

STM32MP251C/F STM32MP253C/F STM32MP255C/F STM32MP257C/F

Datasheet

Arm® based dual Cortex®-A35 1.5 GHz + Cortex®-M33 MPU with AI, 3D GPU, video encoder/decoder, TFT/DSI/LVDS, USB 3.0, PCIe®, crypto

TFBGA361 (16 × 16 mm) pitch 0.8 mm
VFBGA361 (10 × 10 mm) pitch 0.5 mm
VFBGA424 (14 × 14 mm) pitch 0.5 mm
TFBGA436 (18 × 18 mm) pitch 0.8 mm

Product summary	
STM32MP25xC/F	STM32MP251C, STM32MP251F, STM32MP253C, STM32MP253F, STM32MP255C, STM32MP255F, STM32MP257C, STM32MP257F

Features

Includes ST state-of-the-art patented technology.

Cores

- Up to 64-bit dual-core Arm® Cortex®-A35
 - Up to 1.5 GHz
 - 32-Kbyte I + 32-Kbyte D level 1 cache for each core
 - 512-Kbyte unified level 2 cache
 - Arm® NEON™ and Arm® TrustZone®
- 32-bit Arm® Cortex®-M33 with FPU/MPU
 - Up to 400 MHz
 - L1 16-Kbyte I / 16-Kbyte D
 - Arm® TrustZone®
- 32-bit Arm® Cortex®-M0+ in SmartRun domain
 - Up to 200 MHz (up to 16 MHz in autonomous mode)

Memories

- External DDR memory up to 4 Gbytes
 - Up to DDR3L-2133 16/32-bit
 - Up to DDR4-2400 16/32-bit
 - Up to LPDDR4-2400 16/32-bit
- 808-Kbyte internal SRAM: 256-Kbyte AXI SYSRAM, 128-Kbyte AXI video RAM or SYSRAM extension, 256-Kbyte AHB SRAM, 128-Kbyte AHB SRAM with ECC in backup domain, 8-Kbyte SRAM with ECC in backup domain, 32 Kbytes in SmartRun domain
- Two Octo-SPI memory interfaces
- Flexible external memory controller with up to 16-bit data bus: parallel interface to connect external ICs, and SLC NAND memories with up to 8-bit ECC

Security/safety

- Secure boot, TrustZone® peripherals, active tamper, environmental monitors, display secure layers, hardware accelerators
- Complete resource isolation framework

Reset and power management

- 1.71 to 1.95 V and 2.7/3.0 to 3.6 V multiple section I/O supply
- POR, PDR, PVD, and BOR
- On-chip LDO and power-switches for RETRAM, BKPSRAM, V_{SW}, and SmartRun domains
- Dedicated supplies for Cortex®-A35 and GPU/NPU (if present)
- Internal temperature sensors
- Low-power modes: Sleep, Stop, and Standby
- DDR memory retention in Standby mode

- Controls for PMIC companion chip

Low-power consumption

Clock management

- Internal oscillators: 64 MHz HSI, 4/16 MHz MSI, 32 kHz LSI
- External oscillators: 16-48 MHz HSE, 32.768 kHz LSE
- Up to 8× PLLs with fractional mode

General-purpose inputs/outputs

- Up to 172 secure I/O ports with interrupt capability
 - Up to 6 wake-up inputs
 - Up to 8 tamper input pins + 8 active tampers output pins

Interconnect matrix

- Bus matrices
 - 128-, 64-, 32-bit STNoC interconnect, up to 600 MHz
 - 32-bit Arm® AMBA® AHB interconnect, up to 400 MHz

4 DMA controllers to unload the CPU

- 48 + 4 physical channels in total
- 3× dual master port, high-performance, general-purpose, direct memory access controller (HPDMA), 16 channels each
- 1× low-power DMA controller with 4 channels in SmartRun domain

Up to 51 communication peripherals

- 8× I²C FM+ (1 Mbit/s, SMBus/PMBus®)
- 4× I³C (12.5 Mbit/s)
- 5× UART + 4× USART (12.5 Mbit/s, ISO7816 interface, LIN, IrDA, SPI) + 1× LPUART
- 8× SPI (50 Mbit/s, including 3 with full duplex I²S audio class accuracy via internal audio PLL or external clock)(+2 with OCTOSPI + 4 with USART)
- 4× SAI (stereo audio: I²S, PDM, SPDIF Tx)
- SPDIF Rx with 4 inputs
- 3× SDMMC up to 8-bit (SD/eMMC™/SDIO)
- Up to 3× CAN controllers supporting CAN FD protocol, out of which one supports time-triggered CAN (TTCAN)
- 1× USB 2.0 high-speed Host with embedded 480 Mbits/s PHY
- 1× USB 2.0/3.0 high-speed/SuperSpeed dual role data with embedded 480 Mbits/s and 5 Gbits/s PHY (5 Gbits/s PHY shared with PCI Express)
- 1× USB Type-C® Power Delivery control with two CC lines PHY
- 1 × PCI Express with embedded 5 Gbits/s PHY (PHY shared with USB 3.0 SuperSpeed)
- Up to 3× Gigabit Ethernet interfaces
 - 1× Gigabit Ethernet GMAC with one PHY interface (optional)
 - 1× Gigabit Ethernet GMAC with one external PHY interface, optionally internally connected to one embedded Ethernet switch providing two external PHY interfaces
 - TSN, IEEE 1588v2 hardware, MII/RMII/RGMII

- Camera interface #1 (5 Mpixels at 30 fps)
 - MIPI CSI-2®, 2× data lanes up to 2.5 Gbit/s each
 - 8- to 16-bit parallel, up to 120 MHz
 - RGB, YUV, JPG, RawBayer with Lite-ISP
 - Lite-ISP, demosaicing, downscaling, cropping, 3 pixel pipelines
- Camera interface #2 (1 Mpixels at 15 fps)
 - 8- to 14-bit parallel, up to 80 MHz
 - RGB, YUV, JPG
 - Cropping
- Digital parallel interface up to 16-bit input or output

7 analog peripherals

- 3 × ADCs with 12-bit max. resolution (up to 5 Msps each, up to 23 channels)
- Internal temperature sensor (DTS)
- 1× multifunction digital filter (MDF) with up to 8 channels/8 filters
- 1× audio digital filter (ADF) with 1 filter and sound activity detection
- Internal (VREFBUF) or external ADC reference V_{REF+}

Graphics

- Optional 3D GPU: VeriSilicon® - Up to 900 MHz
 - OpenGL® ES 3.1 - Vulkan 1.3
 - OpenCL™ 3.0, OpenVX™ 1.3
 - Up to 150 Mtriangle/s, 900 Mpixel/s
- LCD-TFT controller, up to 24-bit // RGB888
 - Up to FHD (1920 × 1080) at 60 fps
 - 3 layers including a secure layer
 - YUV support, 90° output rotation
- Optional MIPI DSI®, 4× data lanes, up to 2.5 Gbit/s each
 - Up to QXGA (2048 × 1536) at 60 fps
- Optional FPD-1 and OpenLDI JEIDA/VESA (LVDS), up to 2× links of 4× data lanes, up to 1.1 Gbit/s per lane
 - Up to QXGA (2048 × 1536) at 60 fps

Artificial intelligence

- Optional NPU: VeriSilicon® - Up to 900 MHz
 - TensorFlowLite - ONNX - Linux NN

Video processing

- Optional hardware video encoder and decoder up to 600 MHz
 - H264/VP8 up to FHD (1920×1080) at 60 fps
 - JPEG up to 500 Mpixel/s
 - 128 Kbytes of video RAM

Up to 34 timers and 7 watchdogs

- 4× 32-bit timers with up to 4 IC/OC/PWM or pulse counter and quadrature (incremental) encoder input
- 3× 16-bit advanced motor control timers
- 10× 16-bit general-purpose timers (including 2 basic timers without PWM)
- 5× 16-bit low-power timers
- Secure RTC with subsecond accuracy and hardware calendar
- Up to 2× 4 Cortex®-A35 system timers (secure, non-secure, virtual, hypervisor)

- 2× SysTick Cortex®-M33 timer (secure, non-secure)
- 1× SysTick Cortex®-M0+ timer
- 7× watchdogs (5× independent and 2× window)

Hardware acceleration

- AES-128, -192, -256, DES/TDES
- Secure AES-256 with SCA
- RSA, ECC, ECDSA with SCA
- HASH (SHA-1, SHA-224, SHA-256, SHA3), HMAC
- True random number generator
- CRC calculation unit
- “On-the-fly” DDR encryption/decryption (AES-128)
- “On-the-fly” OTFDEC Octo-SPI flash memory decryption (AES-128)

Debug mode

- Arm® CoreSight™ trace and debug: SWD and JTAG interfaces

12288-bit fuses including 96-bit unique ID**All packages are ECOPACK2 compliant**

1 Introduction

This document provides information on STM32MP25xC/F devices, such as description, functional overview, pin assignment and definition, electrical characteristics, packaging and ordering information.

It must be read in conjunction with the STM32MP23/25xx reference manual (RM0457).

For information on the device errata with respect to the datasheet and reference manual, refer to the STM32MP23xx/25xx device errata (ES0598).

For information on the Arm® Cortex®- M33 core, refer to the Cortex®- M33 Technical Reference Manual, available from the www.arm.com website.

Note: Arm is a registered trademark of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

arm

2 Description

STM32MP25xC/F devices are based on the high-performance single or dual-core Arm® Cortex®-A35 64-bit RISC core operating at up to 1.5 GHz. The Cortex®-A35 processor includes a 32-Kbyte L1 instruction cache for each CPU, a 32-Kbyte L1 data cache for each CPU, and a 512-Kbyte L2 cache. The Cortex®-A35 processor uses a highly efficient 8-stage in-order pipeline that has been extensively optimized to provide full Armv8-A features while maximizing area and power efficiency.

STM32MP25xC/F devices also embed a Cortex®-M33 32-bit RISC core operating at up to 400 MHz frequency. The Cortex®-M33 core features a floating point unit (FPU) single precision which supports Arm® single-precision data-processing instructions, and data types. The Cortex®-M33 supports a full set of DSP instructions, TrustZone®, and a memory protection unit (MPU) which enhances application security.

The devices also embed a Cortex®-M0+ 32-bit RISC core operating at up to 200 MHz frequency (16 MHz when running from backup regulator). This processor is located in the SmartRun domain, and can be used to ensure very-low-power peripheral activity when all other processors and domains are stopped.

STM32MP25xC/F devices can also embed a 3D graphic processing unit (VeriSilicon®, OpenGL ES 3.1, Vulkan 1.3, OpenCL 3.0, OpenVX 1.3) running at up to 900 MHz, with performances up to 150 Mtriangle/s, 900 Mpixel/s.

The graphic processing unit can provide a neural processor unit (VeriSilicon®, TensorFlowLite, ONNX, Linux NN) running at up to 900 MHz.

STM32MP25xC/F devices provide an external SDRAM interface supporting external memories up to 32-Gbit density (4 Gbytes), 16- or 32-bit DDR3L up to 1066 MHz, 16- or 32-bit LPDDR4 or DDR4 up to 1200 MHz. The SDRAM content can be encrypted with AES-128.

The devices incorporate high-speed embedded memories: 808 Kbytes of internal SRAM (including 256-Kbyte AXI SYSRAM, 128-Kbyte AXI video SRAM (which can be used as general purpose), two banks of 128 Kbytes each of AHB SRAM, three banks of 8, 8, and 16 Kbytes of AHB SRAM in SmartRun domain, 128 Kbytes of AHB SRAM in backup domain, and 8 Kbytes of SRAM in backup domain), as well as an extensive range of enhanced I/Os and peripherals connected to APB buses, AHB buses, a 32-bit multi-AHB bus matrix, and a 128/64-bit multi-layer AXI interconnect supporting access to internal and external memories.

Each device offers three ADCs, a low-power secure RTC, 12 general-purpose 16-bit timers, 4 general-purpose 32-bit timers, three PWM timers for motor control, five low-power timers, and a true random number generator (RNG), and cryptographic acceleration cells.

STM32MP25xC/F devices offer a video encoder and a video decoder.

The devices support 8 multi-function digital filters (MDF), and one dedicated audio-digital filter with sound-activity detection (ADF).

The devices feature the following standard and advanced communication interfaces.

Standard peripherals

- eight I2Cs
- four I3Cs
- four USARTs and five UARTs
- one low-power UART
- eight SPIs, three I2Ss full-duplex controller/target. The I2S peripherals can be clocked via a dedicated internal audio PLL or via an external clock.
- four SAI serial audio interfaces
- one SPDIF Rx interface
- three SDMMC interfaces
- an USB 2.0 Host with embedded Hi-Speed PHY
- an USB 2.0/3.0 dual-role data with both Hi-Speed and 5Gbits/s SuperSpeed PHYs
- three FDCAN interfaces, including one supporting TTCAN mode (optional)
- two Gigabit Ethernet Interface, with TSN support (optional)
- one Gigabit Ethernet Switch connected to ETH1 and providing two external PHY interfaces, with TSN support (optional)

Advanced peripherals including

- a flexible memory control (FMC) interface

- two Octo-SPI flash memory interface , with on-the-fly content decryption
- two camera interfaces for CMOS sensors, one with basic ISP, demosaicing and parallel or MIPI CSI interface
- an LCD-TFT display interface
- a MIPI DSI display interface (optional)
- an LVDS display interface (optional)

A comprehensive set of power-saving mode allows the design of low-power applications.

STM32MP25xC/F devices are proposed in various packages up to 436 balls with 0.5 mm to 0.8 mm pitch. The set of included peripherals can change with the selected device.

These features make STM32MP25xC/F devices suitable for a wide range of consumer, industrial, white goods and medical applications.

Figure 1 shows the general block diagram of STM32MP25xC/F devices.

Table 1. STM32MP25xC/F features and peripheral counts

Features			STM32MP25xC/F
Package			TFBGA361 (16×16 pitch 0.8 mm), VFBGA361 (10×10 pitch 0.5 mm), VFBGA424 (14×14 pitch 0.5 mm), TFBGA436 (18×18 pitch 0.8 mm) ⁽¹⁾
CPU processor			Up to dual-core Cortex-A35 FPU Neon TrustZone, up to 1500 MHz ⁽¹⁾
ROM			128 Kbytes (only for Cortex-A35)
GPU			Optional VeriSilicon GC8000UL up to 900 MHz ⁽¹⁾
NPU			
MCU processor	-		Cortex-M33 FPU TrustZone
	Caches size		16-Kbyte data cache
			16-Kbyte instruction cache
	Frequency		400 MHz
SmartRun processor	-		Cortex-M0+
	Frequency		16 MHz
Video	Decoder (VDEC)		H264/VP8 up to 1080p60
	Encoder (VENC)		JPEG 500 Mpixel/s ⁽¹⁾
	Video RAM		Up to 128 Kbytes ⁽¹⁾
Embedded SRAM (808 Kbytes)	CPU system		Up to 384 Kbytes ⁽¹⁾
	MCU system		256 Kbytes (128 Kbytes tamper protected)
	MCU retention		128 Kbytes
	SmartRun domain		32 Kbytes
	Backup		8 Kbytes (tamper protected)
SDRAM	DDR3L	1066 MHz	Up to 4 Gbytes ⁽¹⁾
	DDR4	1200 MHz	
	LPDDR4	1200 MHz	
Backup registers			512 bytes (128 × 32-bits, tamper protected)
Timers	Advanced	16 bits	3
	General purpose	16 bits	8
		32 bits	4

Features			STM32MP25xC/F
Timers	Basic	16 bits	2
	Low power	16 bits	5
	SysTick	24 bits	2 (Cortex-M33, secure and non-secure)
		24 bits	1 (Cortex-M0+)
	Cortex-A35 (CNT)	64 bits	Up to 2 × 4 (secure, non-secure, Virtual, Hypervisor) ⁽¹⁾
	RTC		1
	Watchdog		7 (5× independent, 2× window)
Communication Peripherals	SPI	Total	8
		having I2S	3
	I2C (with SMB/PMB support)		8
	I3C		4
	USART (Smartcard, SPI, IrDA, LIN) + UART (IrDA, LIN) ⁽²⁾		4 + 5
	LPUART		1
	SAI		4 (up to 8 audio channels), with I2S master/slave, PCM input, SPDIF-TX
	PCI Express (PCIE)		Yes, 1× TX + 1× RX, embedded 5 Gbit/s PHY
	USB	USB 2.0 Host (USBH)	1 port, embedded Hi-Speed PHY
		USB 2.0/3.0 Dual Role (USB3DR) ⁽²⁾	Yes, embedded Hi-Speed and SuperSpeed 5 Gbit/s PHY
		Embedded PHYs	3 (2× Hi-Speed + 1x SuperSpeed 5 Gbit/s)
		Type-C support (UCPD)	Yes, includes two CC-lines embedded PHY
	SPDIFRX		4 inputs
	FDCAN		Up to 3 ⁽¹⁾
SDMMC (SD, SDIO, e•MMC) ⁽²⁾			3 (8 + 8 + 4 bits).
OCTOSPI ⁽²⁾			2, with AES-128 (CTR) decryption (OTFDEC)
FMC	Parallel address/data 8/16 bits		4× CS, up to 4x 64 Mbytes ⁽¹⁾
	Parallel AD-Mux 8/16 bits		4× CS, up to 4x 64 Mbytes ⁽¹⁾
	NAND 8/16 bits ⁽²⁾		Yes, 4 x CS, SLC, BCH4/8 ⁽¹⁾
Gigabit Ethernet interfaces			Up to 3 ⁽¹⁾
LCD-TFT (LTDC)			Up to 314 MHz pixel clock (when used with DSI or LVDS)
	Parallel interface		Up to 24-bits 150 MHz pixel clock (up to 1080p60)
Display serial interface (DSI)			4× data lanes 2.5 Gbit/s each (up to 1536p60) ⁽¹⁾
LVDS display interface (LVDS)			Up to dual-link of 4× data lanes 1.1 Gbit/s each (up to 1536p60) ⁽¹⁾
Camera interface	-		CSI-2 + RGB/RawBayer parallel
	CSI-2 serial (CSI + DCMIPP)		2× data lanes 2.5 Gbit/s each, path shared with DCMIPP
	Parallel RGB/RawBayer (DCMIPP)		Up to 120 MHz, path shared with CSI.
	Image signal processing (ISP)		Yes, embedded inside DCMIPP

Features		STM32MP25xC/F
Camera interface	Parallel RGB (DCMI)	Up to 80 MHz
Parallel interface (PSSI)		16-bit input or output, path shared with DCMI and DCMIPP
HPDMA		3 instances, 48 physical channels in total
LPDMA		1 instance, 4 physical channels
Cryptography	CRYP (two instances)	DES/TDES (ECB, CBC), AES-256 (ECB, CBC, CTR, GCM, GMAC, CCM)
	Secure AES (SAES)	AES-256 (ECB, CBC, CTR, GCM, GMAC, CCM), hardware attack protections, keys sharing to CRYP
	Public key accelerator (PKA)	Public key primitives for RSA, DH, and ECC over GF(p). 64-bit core
Hash (HASH)		SHA-1, SHA-2 and SHA-3 (up to 512), MD5, HMAC
Random number generator (RNG)		True-RNG. FIPS 140-2 NDRNG (NIST SP800-90B certifiable)
Fuses (one-time programming)		12288 effective bits
Multi-function digital filter (MDF)		8 input channels with 8 filters
Audio digital filter (ADF)		1 input channel with 1 filter and sound-activity detection
GPIOs	with interrupt (total count)	Up to 172 ⁽¹⁾
	Wake-up pins	Up to 6 ⁽¹⁾
	Tamper input/active output pins	Up to 8 inputs and 8 outputs ⁽¹⁾
Up to 12 bit ADC		3 (up to 5 Msps each)
-	ADC channels in total (differential)	Up to 23 channels (or 11 differential) ⁽¹⁾
	VREF generation (VREFBUF)	1.21 V, 1.5 V, or VREF+ input
	VREF+ input pin	Yes

1. See next tables for details.

2. Can be a boot source.

Table 2. STM32MP25xC/F differences per product lines

Feature			STM32MP251x	STM32MP253x	STM32MP255x	STM32MP257x
CPU	Cortex-A35 FPU Neon TrustZone		Single-core	Dual-core		
	Cache size	L1 data + instruction	32 + 32 Kbytes	2 x (32 + 32) Kbytes		
		L2 unified	512 Kbytes	512 Kbytes		
	Frequency	STM32MP25xC	Up to 1200 MHz			
		STM32MP25xF	Up to 1500 MHz			
GPU	For 3D graphics		No		VeriSilicon GC8000UL - Open GL ES 3.2.8 - Vulkan 1.2	
	Performance ⁽¹⁾ / frequency	STM32MP25xC	-		800 MHz, up to 133 Mtriangle/s or 800 Mpixel/s	
		STM32MP25xF	-		900 MHz, up to 150 Mtriangle/s or 900 Mpixel/s	
NPU	For AI processing		No		VeriSilicon GC8000UL - TensorFlowLite - ONNX - Linux NN	

Feature			STM32MP251x	STM32MP253x	STM32MP255x	STM32MP257x
NPU	Performance ⁽¹⁾ / frequency	STM32MP25xC	-		800 MHz, 1.2 TOPS	
		STM32MP25xF	-		900 MHz, 1.35 TOPS	
Video		Decoder (VDEC)	No		H264/VP8 up to 1080p60 - JPEG 500 Mpixel/s ⁽²⁾	
		Encoder (VENC)	No			
		Frequency	-		600 MHz	
Embedded SRAM		Video RAM	No		128 Kbytes, shared between VDEC and VENC ⁽³⁾	
		CPU system	256 + 128 Kbytes			
Timers	A35 (CNT)	64 bits	4 (S, NS, V, H)	2x 4 (secure, non-secure, Virtual, Hypervisor)		
FDCAN			No	3 (1x TT-FDCAN), 10-Kbyte shared buffer		
Gigabit Ethernet interfaces	External interfaces		1, R(G)MII, MII	2, R(G)MII, MII		3, R(G)MII
	GMAC (ETH), TSN, PTP, EEE		1	2		
	3 ports Gigabit Switch (ETHSW)		No	No	No	2 external ports
Display serial interface (DSI)			No		4× data lanes 2.5 Gbit/s each (up to 1536p60)	
LVDS display interface (LVDS)			No		Up to dual-link of 4x data lanes 1.1 Gbit/s each (up to 1536p60) ⁽⁴⁾	

1. GPU and NPU share performance.
2. This is the performance of either VDEC or VENC running alone. VDEC and VENC share performances as they are using same video RAM.
3. If neither VDEC nor VENC are used, the video RAM can be used as general purpose memory, thus giving a total of 384 Kbytes for CPU system.
4. Single or dual-link depends on the package (see next table for details).

Table 3. STM32MP25xC/F differences per packages

Features		STM32MP25xxAJ	STM32MP25xxAL	STM32MP25xxAK	STM32MP25xxAI
		TFBGA361	VFBGA361	VFBGA424	TFBGA436
Packages	Body size (mm)	16×16	10×10	14×14	18×18
	Pitch (mm)	0.8	0.5	0.5	0.8
	Thickness (mm)	1.2	1	1	1.2
	Ball count	361	361	424	436
SDRAM	-		Up to 2 x 4.8 Gbytes/s internal buses. AES-128 encryption/decryption		
	DDR3L	16 bits 1066 MHz	Up to 1 Gbyte, single rank		
		32 bits 1066 MHz	-		Up to 2 Gbytes, single rank
	DDR4	16 bits 1200 MHz	Up to 4 Gbytes, single rank		
		32 bits 1200 MHz	-		Up to 4 Gbytes, single rank
	LPDDR4	16 bits 1200 MHz	Up to 2 Gbytes, single rank		
		32 bits 1200 MHz	-		Up to 4 Gbytes, single rank two channels in parallel (lockstep)

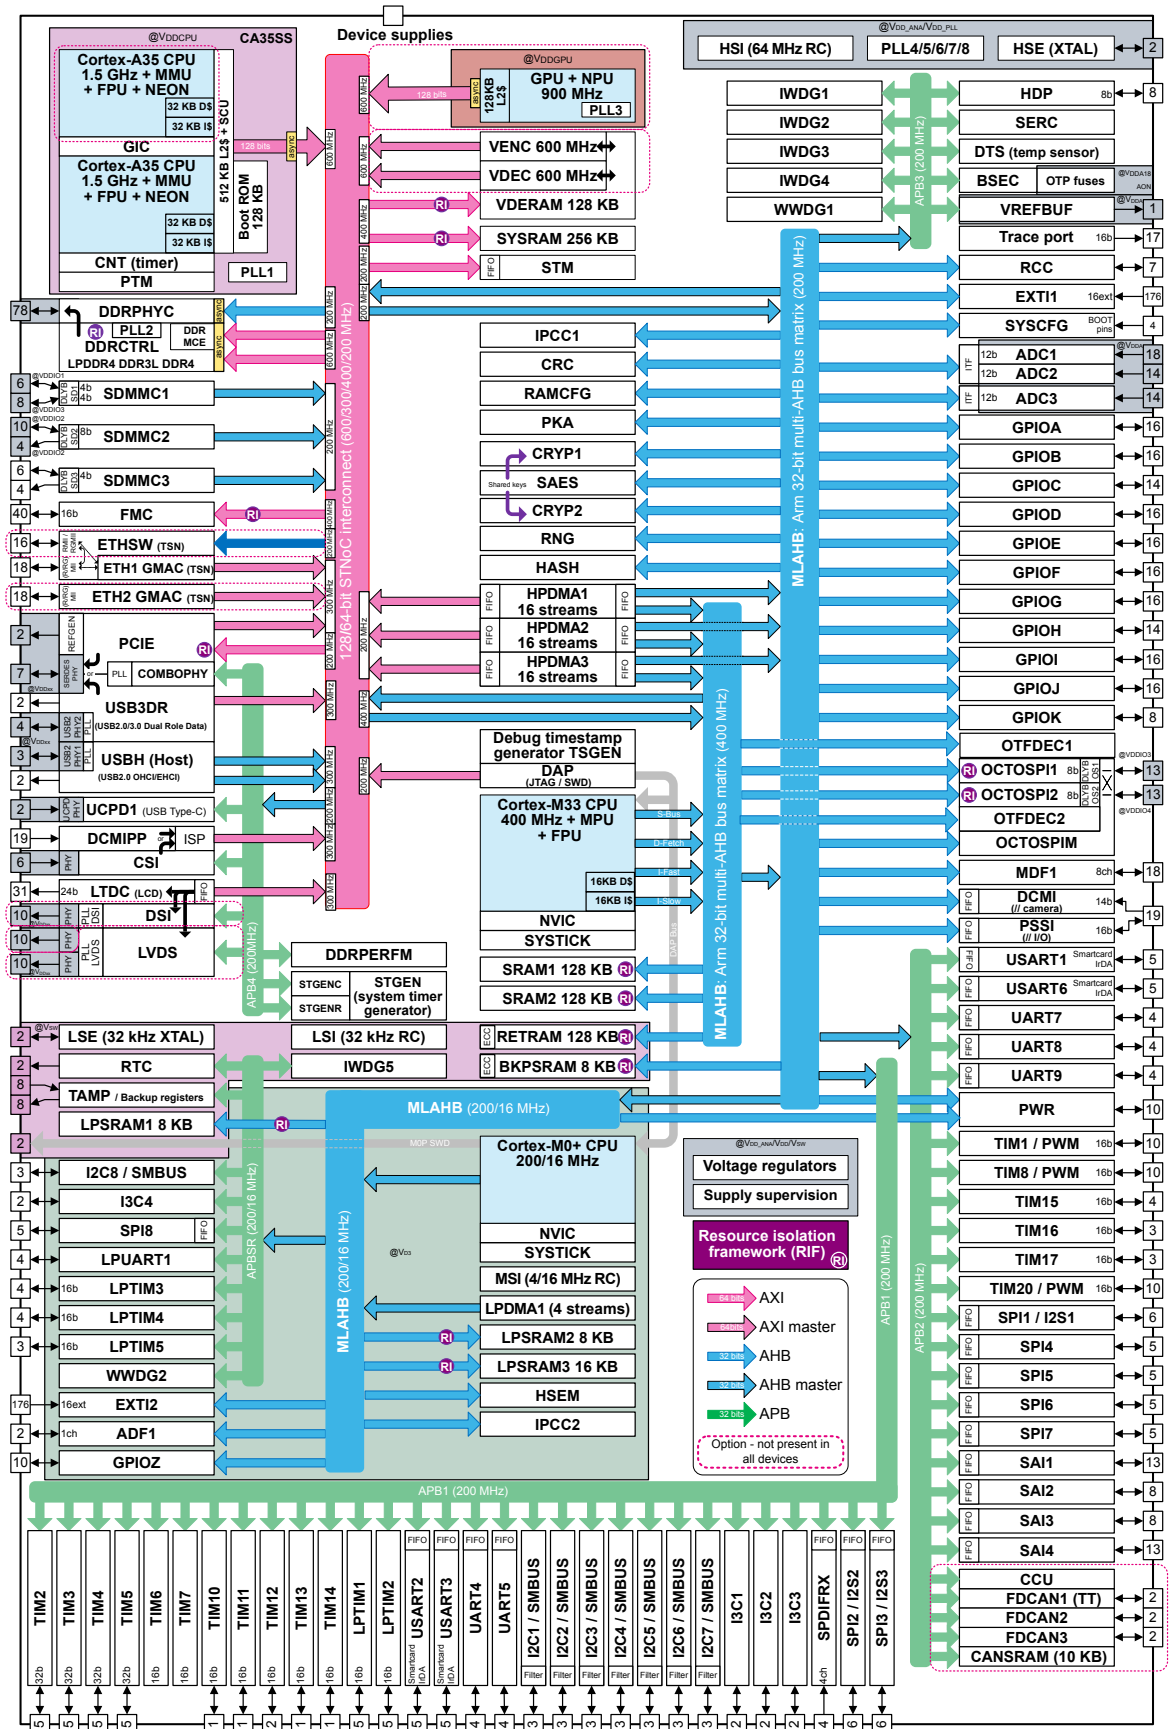

Features		STM32MP25xxAJ	STM32MP25xxAL	STM32MP25xxAK	STM32MP25xxAI
		TFBGA361	VFBGA361	VFBGA424	TFBGA436
FMC	Parallel address.data 8/16-bits	-			4× CS, up to 4× 64 MBytes
	Parallel AD-mux 8/16-bits	4× CS, up to 4× 64 MBytes			
	NAND 8/16-bits ⁽¹⁾	Yes, 4× CS, SLC, BCH4/8			
LVDS display interface (LVDS)		Single-link of 4× data lanes 1.1 Gbit/s each (up to 1080p60) ⁽²⁾		Dual-link of 4× data lanes 1.1 Gbit/s each (up to 1536p60) ⁽²⁾

ADC	ADC channels in total (differential)	23 (11) ⁽³⁾	23 (11) ⁽³⁾	21 (10)	23 (11) ⁽³⁾

1. Can be a boot source.

2. Availability depends on device.

3. Including 2 (or 1 differential) low-noise inputs on dedicated ANA0/ANA1 pins.

Figure 1. STM32MP25xC/F block diagram

3 Functional overview

3.1 Dual-core Arm Cortex-A35 subsystem (CA35SS)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

3.1.1 Features

- Armv8-A architecture
- AArch32 for full backward compatibility with Armv7
- AArch64 for 64-bit support and new architectural features
- 32-Kbyte L1 instruction cache for each CPU
- 32-Kbyte L1 data cache for each CPU
- 512-Kbyte level2 cache
- Arm A64 + A32 + Thumb-2 instruction set
- Arm TrustZone security technology
- Arm NEON advanced SIMD
- DSP and SIMD extensions
- VFPv4 floating-point
- Hardware virtualization support
- Performance monitoring Unit (PMU)
- Program trace macrocell (PTM) that supports instruction trace only
- Integrated generic interrupt controller (GIC) with 384 shared peripheral interrupts
- Integrated generic timer (CNT)

Note: The cryptographic extension is not supported.

3.1.2 Overview

The Cortex-A35 processor uses a highly-efficient 8-stage in-order pipeline that has been extensively optimized to provide full Armv8-A features while maximizing area and power efficiency.

3.1.2.1 Thumb-2 technology

Delivers the peak performance of traditional Arm code, while also providing up to a 30 % reduction in memory requirement for instructions storage.

3.1.2.2 TrustZone technology

Ensures reliable implementation of security applications ranging from digital rights management to electronic payment. Broad support from technology and industry partners.

3.1.2.3 PMU

The PMU provides six performance monitors that can be configured to gather statistics on the operation of each core and the memory system. The information can be used for debug and code profiling.

3.1.2.4 NEON and FPU

Advanced SIMD is a media and signal processing architecture that adds instructions primarily for audio, video, 3-D graphics, image, and speech processing. The floating-point architecture provides support for single-precision and double-precision floating-point operations.

All scalar floating-point instructions are available in the A64 instruction set. All VFP instructions are available in A32 and T32 instruction sets. The same advanced SIMD instructions are available in both A32 and T32 instruction sets. The A64 instruction set offers additional advanced SIMD instructions, including double-precision floating-point vector operations.

3.1.2.5 **Hardware virtualization**

Highly efficient hardware support for data management and arbitration, whereby multiple software environments and their applications are able to simultaneously access the system capabilities. This enables the realization of devices that are robust, with virtual environments that are well isolated from each other.

3.1.2.6 **Optimized L1 caches**

Performance and power optimized L1 caches combine minimal access latency techniques to maximize performance and minimize power consumption. There is also the option of cache coherence for enhanced inter-processor communication, or support of a rich SMP capable OS for simplified multicore software development.

3.1.2.7 **Integrated L2 cache controller**

Provides low-latency and high-bandwidth access to cached memory in high-frequency, or to reduce the power consumption associated with off-chip memory access.

3.1.2.8 **Snoop control unit (SCU)**

The SCU is responsible for managing the interconnect, arbitration, communication, cachetocache and system memory transfers, cache coherence and other capabilities for the processor.

This system coherence also reduces software complexity involved in maintaining software coherence within each OS driver.

3.1.2.9 **Generic interrupt controller (GIC)**

Implementing the standardized and architected interrupt controller, the GIC provides a rich and flexible approach to inter-processor communication, and the routing and prioritization of system interrupts.

Supporting up to 416 independent interrupts (including 384 shared interrupt), under software control, each interrupt can be distributed across Cortex-A35 cores, hardware prioritized, and routed between the operating system and TrustZone software management layer.

This routing flexibility and the support for virtualization of interrupts into the operating system, provide one of the key features required to enhance the capabilities of a solution utilizing an hypervisor.

3.2 **Arm Cortex-M33 core with TrustZone and FPU (CM33)**

The Arm Cortex-M33 core with TrustZone and FPU is a 32-bit RISC processor that features exceptional code-efficiency, delivering the high-performance expected from an Arm core in the memory size usually associated with 8- and 16-bit devices.

It is comprised of:

- Arm TrustZone technology, using the Armv8-M main extension supporting secure and non-secure states
- Floating-point extension (FPU)
- Armv8-M DSP extension
- A nested vectored interrupt controller (NVIC) is closely integrated with the processor
- A memory system with memory protection unit (MPU) with up to 16 non-secure regions and 16 secure regions
- A security attribution unit (SAU) with up to eight regions
- An implementation defined attribution unit (IDAU)
- Debug components including breakpoints (BPU), data watchpoints (DWT), instrumentation, and processor trace (ITM/ETM), cross-trigger interface (CTI)
- 16-Kbyte instruction and 16-Kbyte data caches (ICACHE/DCACHE)

3.3 **Arm Cortex-M0+ core (CM0P)**

The Cortex-M0+ processor is built on a highly area- and power-optimized 32bit core, with a 2-stage pipeline Von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier.

The Cortex-M0+ processor provides the exceptional performance expected of a modern 32bit architecture, with a higher code density than other 8bit and 16bit microcontrollers.

The Cortex-M0+ is tightly coupled with a nested vectored interrupt controller (NVIC)

3.4 Graphic processing unit (GPU)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

STM32MP25xC/F devices include a 3D graphics engine (VeriSilicon GC8000UL).

The GPU is a dedicated graphics processing unit accelerating numerous 3D graphics applications such as graphical user interface (GUI), menu display or animations. It works together with an optimized software stack design for industry-standard APIs with support for Android™ and Linux® embedded development platforms.

The GPU is used to accelerate parallel computing (GPGPU), via the typical OpenCL or Vulkan API, or more image-based API like OpenVX or OpenCV. This wide support guarantees to be able to accelerate any application up to the most recent ones, with graphic performances reaching 25.6 GFlops.

The GPU is built in a separate power domain, which allows the GPU to be switched off when not used in the long-term, or even to play with dynamic voltage frequency scaling (DVFS).

The GPU graphic hardware acceleration is exposed through the following API:

- OpenVG 1.2 for 2D or curve drawing
- OpenGL/ES 3.1 for 3D apps (backward compatible: OES2.1 and OES1.1)
- Vulkan 1.3 for modern 3D apps
- OpenCL 3.0 for parallel programming
- OpenVX 1.3 for acceleration of computer vision applications

The GPU provides the following graphic theoretical performance (values for 800 MHz):

- Vertex: 200 MVtx/s
- Triangle: 133 MTrg/s
- Texel: 800 MTex/s
- Pixel: 800 MPix/s
- Float 16bit: 25.6 GFlops
- Float 32bit: 12.8 GFlops

3.5 Neural processor unit (NPU)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

The NPU provides powerful hardware acceleration for neural network, to allow efficient artificial intelligence (AI) applications.

The NPU acceleration is implemented by hardware neural operator inserted into the GPU. As such, it benefits of both optimized hardware (the neural operator), and of the flexibility and efficiency of the existing GPU shaders.

The NPU neural hardware acceleration is exposed through the following API:

- TensorFlowLite-API
- ONNX
- Linux NN-API-Adapter

The NPU flexibility is used to optimally accelerate the following frameworks (nonexhaustive list)

- TensorFlow non-exhaustive hardware support
- TensorFlowLite full hardware support (including its SoftMax subset)
- Caffe, Caffe2
- CNTK, Torch, Theano, Darknet

The NPU provides the following neural theoretical performance, below values for 800 MHz (values for 900 MHz overdrive inside parenthesis):

- Integer operations: 1.2 (1.35) TOPS (8-bit integer)

To reduce the required DDR bandwidth during neural computations, the NPU embeds natively 128 Kbytes of memory.

3.6 Memories

3.6.1 External SDRAM

STM32MP25xC/F devices embed a controller for the external SDRAM which supports the following devices

- DDR3L, 16- or 32-bit data, up to 2 Gbytes, up to DDR3L-2133 (1066 MHz clock)
- DDR4, 16- or 32-bit data, up to 4 Gbytes, up to DDR4-2400 (1200 MHz clock)
- LPDDR4, 16- or 32-bit data, up to 4 Gbytes, up to LPDDR4-2400 (1200 MHz clock)

3.6.2 Embedded SRAM

All devices feature:

- SYSRAM in MPU domain: 256 Kbytes with half/full hardware erase mechanism on reset
- VDERAM in MPU domain: 128 Kbytes (not usable when either VDEC or VENC is used) with hardware erase mechanism on enable as general purpose RAM
- SRAM1 in MCU domain: 128 Kbytes with hardware erase mechanism on tamper detection
- SRAM2 in MCU domain: 128 Kbytes
- LPSRAM1 in SmartRun domain: 8 Kbytes with hardware erase mechanism on reset
The content of this area can be retained in Standby or V_{BAT} mode, and can be protected by the CRC mechanism.
- LPSRAM2 in SmartRun domain: 8 Kbytes with hardware erase mechanism on reset
- LPSRAM3 in SmartRun domain: 16 Kbytes
- RETRAM (retention RAM): 128 Kbytes with hardware erase mechanism on reset
The content of this area can be retained in Standby or V_{BAT} mode, and can be protected by ECC and CRC mechanisms.
- BKPSRAM (backup SRAM): 8 Kbytes with hardware erase mechanism on tamper detection
The content of this area can be protected against possible unwanted accesses, and can be retained in Standby or V_{BAT} mode. The content can also be protected by ECC mechanism.

3.7 DDR3L/DDR4/LPDDR4 controller (DDRCTRL)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

DDRCTRL combined with DDRPHYC provides a complete 16-/32-bit memory interface solution for DDR memory subsystem.

- JEDEC compliant LPDDR4 SDRAM up to 2400 MT/s
- JEDEC compliant DDR4 SDRAM up to 2400 MT/s with DLL on-range
- JEDEC compliant DDR3L SDRAM up to 2133 MT/s with DLL on-range
- 2 x 128-bit AXI4 ports
 - up to 16 QoS levels and up to 3 traffic classes are supported per direction.
 - CID-based firewalling function with poisoning output signaling
 - 1 port provided with AES- 128 encryption/decryption with programmable memory range (DDRMCE)

Low-power features:

- Linked with the RCC, ability to move the DDR memory subsystem in self-refresh through automatic way, hardware way, or software way (ASR, HSR, and SSR).

3.8 Boot modes

At startup, the boot source used by the internal boot ROM is selected by BOOT pins and OTP settings.

Table 4. Default interfaces

Unless otherwise mentioned in table below.

Boot source	When used by Cortex-A35	When used by Cortex-M33
SD-Card	SDMMC1	
eMMC	SDMMC2	
Serial NOR, HyperFlash and serial NAND	OCTOSPIM port1	OCTOSPIM port2
SLC NAND	FMC	
USB	USB3DR (high-speed only)	-

Boot source	When used by Cortex-A35	When used by Cortex-M33
UART	USART2/6 and UART5/8/9	-

Table 5. Boot sources

BOOT[3:0] pins	Alternate boot pins OTP value							
	0b00 (default)				0b01	0b10	0b11	
	Cortex-A35 master	Cortex-M33 master	Cortex-M33 master ⁽¹⁾		Cortex-A35 master	Cortex-M33 master	Cortex-M33 master ⁽¹⁾	
			Cortex-A35	Cortex-M33			Cortex-A35	Cortex-M33
0	UART and USB ^{(2) (3)}							
1	SD-Card	-	-	-	SD-Card	SD-Card	Serial NAND	Serial NOR
2	e•MMC	-	-	-	e•MMC	e•MMC	e•MMC	Serial NOR
3	Development boot ⁽²⁾							
4	Serial NOR	-	-	-	Serial NOR	Serial NOR	SLC NAND	Serial NOR
5	Serial NAND	-	-	-	-	-	e•MMC ⁽⁴⁾	Serial NOR
6	SLC NAND	-	-	-	-	-	e•MMC ⁽⁴⁾	HyperFlash™
7	-	SD-Card	-	-	HyperFlash™	HyperFlash™	Serial NAND	HyperFlash™
8	-	e•MMC	-	-	Serial NAND	Serial NAND	e•MMC	HyperFlash™
9	-	-	Serial NAND	Serial NOR	-	-	SD-Card ⁽⁵⁾	Serial NOR

12	Development boot ⁽²⁾							
13	-	-	e•MMC	Serial NOR	SD-Card ⁽⁵⁾	SD-Card ⁽⁵⁾	SD-Card	Serial NOR
14	-	-	SD-Card	Serial NOR	e•MMC ⁽⁴⁾	e•MMC ⁽⁴⁾	SD-Card	HyperFlash™
15	UART and USB ⁽³⁾							

- Two flash memory config. Indirect Cortex-A35 boot (from Cortex-M33) or used during Cortex-A35 D1Standby exit
- Cannot be override by OTP.
- Wait incoming connection on USART2/6 or UART5/8/9 on default pins and USB high-speed device on USB3DR_DP/DM.
- eMMC on SDMMC1
- SD-Card on SDMMC2
- Only 8-bit memory is supported as some FMC and OCTOSPI port2 pins are shared (usage of FMC in 16-bit mode is exclusive of usage of OCTOSPI port2).

The default pins used during boot are described in [Table 6](#).

Note: There are few mutual exclusions with this default settings. SDMMC2 cannot be used with FMC. OCTOSPI Port2 cannot be used with FMC 16 bits. OCTOSPI port2 in 8-bit mode cannot be used with FMC.

Table 6. Minimum set of default pins used during boot ROM phase

Most can be changed using OTP settings. This table is for default OTP settings.

Interface	type		Signal	Pin	IO supply domain
FMC	SLC NAND 8-bits	SLC NAND 16-bits	FMC_NOE	PE15	VDDIO2 ⁽¹⁾
			FMC_RNB	PE13	
			FMC_NWE	PE14

UART9			UART9_RX	PB14	VDD
			UART9_TX	PD13	

1. Some FMC and SDMMC2 pins are shared, this means that usage of FMC is exclusive of usage of SDMMC2.
2. Some FMC and OCTOSPIM port2 pins are shared, this means that usage of FMC in 16-bit mode is exclusive of usage of OCTOSPIM Port2.
3. Only used as input by boot ROM

Although low-level boot is done using internal clocks, ST supplies software packages as well as major external interfaces (such as DDR or USB) require a crystal or an external oscillator to be connected on HSE pins.

See the product reference manual for constraints and recommendations regarding connection of HSE pins and supported frequencies.

3.9 Power supply management (PWR)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

3.9.1 Power supply scheme

The system requires supply on V_{DD}, V_{DDA18AON}, V_{DDCPU} and V_{DDCORE} to start, and to allow independent supplies for V_{DDGPU}, V_{DDA18ADC}, V_{BAT}, V_{DD33USB}, V_{DD33UCPD}, V_{DDIO2}, V_{DDIO3}, V_{DDIO4}, V_{DDIO1}, and V_{DDQDDR}.

- V_{DD} power supply input for I/Os (1.8 V or 3.3 V typical)
- V_{DDA18AON} power supply input for system analog such as reset, power management, oscillators and OTP
- V_{BAT} optional power supply input for backup domain, and optionally D3 domain when V_{DD} is not present (V_{BAT} mode)
- V_{DDCORE} digital core domain supply, dependent on V_{DD} supply. V_{DD} must be present before V_{DDCORE}.
 - V_{DDCSI}, V_{DDDSI}, V_{DDLVS}, V_{DDCOMBOPHY}, V_{DDCOMBOPHYTX}, and V_{DDPCIECLK} are usually connected to V_{DDCORE}.
- V_{DDCPU} digital CPU domain supply (Cortex-A35), dependent on V_{DD} supply. V_{DD} must be present before V_{DDCPU}.
- V_{DDGPU} digital GPU domain supply, dependent on V_{DD} supply. V_{DD} must be present before V_{DDGPU}.
- V_{DDQDDR} DDR I/O supply

- $V_{DDA18ADC}$ analog power supply input for ADCs and voltage reference buffers, independent from any other supply
- V_{REF+} external reference voltage for ADCs, independent from any other supply
 - reference voltage output when the voltage reference buffer is enabled
 - independent external reference voltage input when the voltage reference buffer is disabled
- V_{SSA} separate analog and reference voltage ground
- $V_{DD33USB}$ supply input for USB HS PHY, independent from any other supply
- $V_{DD33UCPD}$ supply input for USB Type-C CC1 and CC2 pins, independent from any other supply
- V_{DDIO3} supply input, mostly for OCTOSPIM_P1 I/Os, independent from any other supply
- V_{DDIO4} supply input, mostly for OCTOSPIM_P2 I/Os, independent from any other supply
- V_{DDIO2} supply input, mostly for e.MMC I/Os, independent from any other supply
- V_{DDIO1} supply input, mostly for SD Card I/Os, independent from any other supply
- V_{SS} common ground for all supplies except for analog

3.9.2 Power-supply supervisor

The devices have an integrated power-on reset (POR) and power-down reset (PDR) circuitry, coupled with a brownout reset (BOR) circuitry:

- **Power-on reset (POR)**
The POR supervisor monitors V_{DD} and $V_{DDA18AON}$ power supplies, and compares them to a fixed threshold. The devices remain in reset mode when V_{DD} and $V_{DDA18AON}$ are below this threshold.
- **Power-down reset (PDR)**
The PDR supervisor monitors V_{DD} and $V_{DDA18AON}$ power supplies. A reset is generated when V_{DD} or $V_{DDA18AON}$ drops below a fixed threshold.
- **Brownout reset (BOR)**
The BOR supervisor monitors V_{DD} power supply. A 2.7 V BOR thresholds can be enabled through option bytes. A reset is generated when V_{DD} drops below this threshold. The BOR must not be enabled when $V_{DD} = 1.8$ V typ. is used.
- **Power-on reset V_{DDCORE} (POR_VDDCORE)**
The POR_VDDCORE supervisor monitors V_{DDCORE} power supply, and compares it to a fixed threshold. The V_{DDCORE} domain remains in reset mode when V_{DDCORE} is below this threshold,
- **Power-down reset V_{DDCORE} (PDR_VDDCORE)**
The PDR_VDDCORE supervisor monitors V_{DDCORE} power supply. A V_{DDCORE} domain reset is generated when V_{DDCORE} drops below a fixed threshold.
- **Power-on reset V_{DDCPU} (POR_VDDCPU)**
The POR_VDDCPU supervisor monitors V_{DDCPU} power supply, and compares it to a fixed threshold. The V_{DDCPU} domain remains in reset mode when V_{DDCPU} is below this threshold.
- **Power-down reset V_{DDCPU} (PDR_VDDCPU)**
The PDR_VDDCPU supervisor monitors V_{DDCPU} power supply. A V_{DDCPU} domain reset is generated when V_{DDCPU} drops below a fixed threshold.
- **Power-on reset V_{SW} (POR_VSW)**
The POR_VSW supervisor monitors V_{SW} power supply, and compares it to a fixed threshold. The V_{SW} domain remains in reset mode when V_{SW} is below this threshold.

The devices also include monitoring which can generate tamper events, interrupt, or wake-up:

- **Programmable voltage detector (PVD)**
The PVD monitors the PVD_IN pin, and compares it to a fixed threshold. An interrupt or a wake-up can be generated when PVD_IN is below or above the threshold.
- **V_{DDCORE} monitoring**
Monitors V_{DDCORE} power supply and compares it to a fixed threshold. A tamper event, an interrupt, or a wake-up can be generated when V_{DDCORE} is below or above the threshold.

- **V_{DDCPU} monitoring**
Monitors V_{DDCPU} power supply, and compares it to a configurable threshold. A tamper event, an interrupt, or a wake-up can be generated when V_{DDCPU} is below or above the threshold.
- **V_{DDGPU} monitoring**
Monitors V_{DDGPU} power supply and compares it to a configurable threshold. An interrupt or a wake-up can be generated when V_{DDGPU} is below or above the threshold. A GPU reset is also generated if V_{DDGPU} is below the threshold (VDDGPURDY = 0).
- **Peripheral voltage monitoring**
Monitors independently V_{DDIO2}, V_{DDIO3}, V_{DDIO4}, V_{DDIO1}, V_{DD33UCPD}, V_{DD33USB} and V_{DDA18ADC} power supplies with fixed thresholds. An interrupt or a wake-up can be generated when supplies are below or above the thresholds.

3.10 Low-power strategy

Several low-power modes are available to save power when the Cortex-A35 and/or the Cortex-M33 do not need to execute code (when waiting for an external event). It is up to the user to select the mode that gives the best compromise between low-power consumption, short startup time, and available wake-up sources.

- Slowing down system clocks (see RCC section in the reference manual)
- Controlling individual peripheral clocks (see RCC section in the reference manual)
- Low-power modes:
 - CSleep (CPU clock stopped)
 - CStop (CPU subsystem clock stopped)
 - D1 DStop1 (CPU subsystem clock stopped, normal mode signaled to external regulator)
 - D1 DStandby (domain power down and wake up via reset)
 - Stop1, LP-Stop1, and LPLV-Stop1 (system clock stalled, normal, or low-power mode signaled to external regulator supplying the VDDCPU and the VDDCORE)
 - Stop2, LP-Stop2, and LPLV-Stop2 (system clock stalled, powered down mode signaled to external regulator supplying the VDDCPU, and normal or low-power mode signaled to external regulator supplying the VDDCORE)
 - Standby1 (system powered down and D3 domain in autonomous mode running with local clocks)
 - Standby2 (system powered down, D3 domain also in power down)

3.11 Resource isolation framework (RIF)

The RIF is a comprehensive set of hardware blocks designed to enforce and manage the isolation of STM32 hardware resources like memory and peripherals.

Within a defined hardware execution compartment (eight are available), privileged, unprivileged, secure, and non-secure application software can assign their own embedded memory buffers, external memory regions, and peripherals thanks to the RIF hardware.

The RIF architectural framework extends to FMC, SYSCFG, IPCC, HSEM, DMA, RTC, TAMP, RCC, PWR, EXTI, or GPIO.

3.12 Reset and clock controller (RCC)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

The RCC manages the generation of all clocks, as well as the clock gating and the control of system and peripheral resets. It provides a high flexibility in the choice of clock sources, and allows application of clock ratios to improve the power consumption. In addition, on some communication peripherals that are capable to work with two different clock domains (either a bus interface clock or a kernel peripheral clock), the system frequency can be changed without modifying the peripheral activity rate.

3.12.1

Features

- RIF aware
- Reset part:
 - Generation of local and system reset
 - Bidirectional pad reset (NRST) to reset of external devices, or to reset the device
 - Output pad reset (NRSTC1MS) to reset of external mass-storage devices used by the Cortex-A35
- Clock generation part:
 - Generation and distribution of clocks for the complete system
 - 5 separate PLLs (excluding external Cortex-A35, DDRCTRL, and GPU ones):
 - Integer or fractional mode
 - Spread-spectrum function to reduce the amount of EMI peaks
 - Possibility to change on-the-fly the fractional ratios of the PLLs
 - Smart clock gating for reduction of power dissipation
 - 2 external oscillators:
 - HSE that supports a wide range of crystals: 16 to 48 MHz
 - LSE for 32.768 kHz crystals
 - 3 Internal oscillators:
 - HSI that runs around 64 MHz
 - MSI that runs around 16 MHz or 4 MHz
 - LSI that runs around 32 kHz
 - Buffered clock outputs for external devices
- Two independent interrupt interfaces (one dedicated to Cortex-A35, and one dedicated to Cortex-M33)
- Two independent failure events (HSE and LSE)
- Two independent events to wake up processors (one dedicated to Cortex-A35 and one dedicated to Cortex-M33)

3.12.2

Clock management

The RCC provides a high flexibility to the application in the choice of the clock generators:

- From HSI, high-speed internal oscillator (~ 64 MHz)
- From HSE, high-speed external oscillator (16 to 48 MHz)
- From LSE; low-speed external oscillator (32 kHz)
- From LSI, low-speed internal oscillator (~ 32 kHz)
- From MSI, low-power internal oscillator (~ 4 MHz or ~ 16 MHz)

The RCC offers a good flexibility for the application to select the appropriate clock for CPUs and peripherals. More especially for peripherals that need a specific clock like SPI(I2S), SAI, and SDMMC.

Each clock source can be switched on or off independently to optimize the power consumption.

There are mainly three clock paths:

- Cortex-A35 bus matrix
- Cortex-M33 and its bus matrix
- Peripheral kernel clocks

The Cortex-A35, the GPU, and DDRCTRL clocking are derived locally because of high frequency use. The RCC manages only source clocks for their related local PLLs.

3.12.3

Reset sources

There are several sources able to generate a reset:

- Supply monitors (V_{DD} , V_{DDCORE} , V_{DDCPU} , V_{DDGPU} or V_{SW}) lower than expected values
- Independent watchdog timeout
- D1 domain exit from DStandby state
- Exit from Standby mode
- External signals driving the NRST pin

- Software commands

The coverage (or scope) of the resets differ according to the source initiating the reset, with the following categories:

- Power-on/off resets
- System resets
- Local resets

An application reset can be generated from one of the following sources:

- Reset from the NRST pin
- Reset from low-voltage detection on VDD
- Reset from the independent watchdogs
- Software reset from RCC registers
- Failure on HSE
- RETRAM CRC or ECC error

A system reset can be generated from one of the following sources:

- Reset from application reset
- Reset from low-voltage detection on V_{DDCORE}
- A reset from low-voltage detection on V_{DDCPU}

The NRST reset is activated by:

- Low voltage on V_{DD}
- Failure on HSE
- Reset from the independent watchdogs
- Software reset from RCC registers
- RETRAM CRC or ECC error
- Assertion of NRST by an external source

3.13 Hardware semaphore (HSEM)

The hardware semaphore provides 16 (32-bit) register-based semaphores.

The semaphores can be used to ensure synchronization between different processes that run on a core and between different cores. The HSEM provides a non-blocking mechanism to lock semaphores in an atomic way.

The following functions are provided:

- Locking a semaphore can be done in two ways:
 - 2-step lock: by writing CoreID and ProcessID to the semaphore, followed by a read check.
 - 1-step lock: by reading the CoreID from the semaphore
- Interrupt generation when a semaphore is freed
 - Each semaphore can generate an interrupt on one of the interrupt lines.
- Semaphore clear protection
 - A semaphore is only cleared when CoreID and ProcessID matches.
- Global semaphore clear per CoreID

3.14 Inter-processor communication controller (IPCC1/2)

The IPCC is used to communicate data between two processors. It provides a non-blocking signaling mechanism to post and retrieve communication data in an atomic way (signaling for 16 channels for IPCC1, and four channels for IPCC2).

The IPCC communication data must be in a common memory, which is not part of the IPCC.

3.14.1 Main features

- Status signaling for the four channels
 - Channel occupied/free flag, also used as lock

- Two interrupt lines per processor
 - One for RX channel occupied (communication data posted by sending processor)
 - One for TX channel free (communication data retrieved by receiving processor)
- Interrupt masking per channel
 - Channel occupied mask
 - Channel free mask
- Two channel operation modes
 - Simplex (each channel has its own communication data memory location)
 - Half duplex (a single channel is associated to a bidirectional communication data information memory location)

3.15 General-purpose input/outputs (GPIO)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain, with or without pull-up or pull-down), as input (with or without pull-up or pull-down), or as peripheral alternate function. Some of the GPIO pins are shared with digital or analog alternate functions. All GPIOs are high-current-capable and have speed selection to better manage internal noise, power consumption and electromagnetic emission.

After reset, all GPIOs are in analog mode to reduce power consumption.

The I/O configuration can be locked if needed by following a specific sequence in order to avoid spurious writing to the I/O registers.

Access to each GPIO configuration bits can be restricted to secure-only and/or privileged-only. These configuration bits can also be allocated to a specific CPU.

3.16 Bus-interconnect matrix

For more details on interconnect, see the reference manual (STM32MP23/25xx reference manual (RM0457)).

DT69004V3

3.17 High-performance DMA controllers (HPDMA1/2/3)

- AXI master and AHB master
- Memory-mapped data transfers from a source to a destination:
 - Peripheral-to-memory
 - Memory-to-peripheral
 - Memory-to-memory
 - Peripheral-to-peripheral
- Autonomous data transfers during Sleep and Stop modes
- Per channel event generation
- Per channel interrupt generation
- 16 concurrent DMA channels
- Per channel FIFO
- Linked-list support
- TrustZone support
- Privileged/unprivileged support
- Channel isolation support

3.18 Low-power DMA controller (LPDMA1)

- AHB master
- Memory-mapped data transfers from a source to a destination:
 - Peripheral-to-memory
 - Memory-to-peripheral
 - Memory-to-memory
 - Peripheral-to-peripheral
- Autonomous data transfers during Sleep and Stop modes
- Per channel event generation
- Per channel interrupt generation
- 4 concurrent DMA channels
- Linked-list support
- TrustZone support
- Privileged/unprivileged support
- Channel isolation support

3.19 Cortex-M33 nested vectored interrupt controller (NVIC)

The devices embed a NVIC that can support up to 320 maskable interrupt channels, not including the Cortex®-M33 interrupt lines.

- 16 programmable priority levels
- Closely coupled NVIC gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Early processing of interrupts
- Processing of late arriving, higher-priority interrupts
- Tail chaining
- Processor context automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

NVIC registers are banked across secure and non-secure states.

The NVIC provides flexible interrupt management features with minimum interrupt latency.

3.20 Cortex-M0+ nested vectored interrupt controller (NVIC)

The devices embed an NVIC that can support up to 32 maskable interrupt channels, not including the Cortex-M0+ core interrupt lines.

- 4 programmable priority levels
- Closely coupled NVIC that gives low-latency interrupt processing
- Interrupt entry vector table address passed directly to the core
- Early processing of interrupts
- Processing of late arriving, higher-priority interrupts
- Support tail chaining
- Processor context automatically saved
- Interrupt entry restored on interrupt exit with no instruction overhead

This NVIC provides flexible interrupt management features with minimum interrupt latency.

3.21 Extended interrupt and event controller (EXTI1/2)

The EXTI manages individual CPU and system wake-up through configurable and direct event inputs. It provides wake-up requests to the power control, and generates an interrupt request to the CPU NVIC or GIC, and events to the CPU event inputs. For each CPU, an additional event generation block (EVG) is needed to generate the CPU event signal.

The EXTI wake-up requests allow the system to be woken up from Stop mode, and CPUs to be woken up from CStop and CStandby modes.

The interrupt request and event request generation can also be used in Run mode.

The EXTI also includes the EXTI I/O port selection.

Each interrupt or event can be set as secure to restrict access to secure software only.

EXTI1 is shared between Cortex-A35 and Cortex-M33 while EXTI2 is shared between all cores.

3.22 Cyclic redundancy check calculation unit (CRC)

The CRC calculation unit is used to get a CRC code using a programmable polynomial.

Among other applications, CRC-based techniques are used to verify data transmission or storage integrity. In the scope of the EN/IEC 60335-1 standard, they offer a means of verifying the flash memory integrity.

The CRC calculation unit helps computing a signature of the software during runtime, to be compared with a reference signature generated at link-time and stored at a given memory location.

3.23 Flexible memory controller (FMC)

The FMC main features are the following:

- Interface with static-memory mapped devices including:
 - NOR flash memory
 - Static or pseudo-static random-access memory (SRAM, PSRAM)
 - NAND flash memory with 4-bit/8-bit BCH hardware ECC
- 8-, 16-bit data bus width
- Independent chip-select control for each memory bank
- Independent configuration for each memory bank
- Write FIFO

3.24 Octo-SPI memory interface (OCTOSPI1/2)

The OCTOSPI supports two protocols used by most external serial memories such as serial PSRAMs, serial NAND and serial NOR flash memories, HyperRAMs, and HyperFlash memories:

- Indirect mode: all the operations are performed using the OCTOSPI registers.
- Automatic status-polling mode: the external memory status register is periodically read, and an interrupt can be generated in case of flag setting.
- Memory-mapped mode: the external memory is memory mapped, and is seen by the system as if it was an internal memory supporting both read and write operations.

The OCTOSPI supports multiple protocols:

- XSPI protocol and its various flavors (such as XCELLA, OCTABUS, HyperBus™ as defined by memory providers)

3.25 On-the-fly decoder (OTFDEC1/2)

The OTFDEC is used to decrypt on-the-fly AHB traffic based on the read request address information. Four independent and non-overlapping encrypted regions can be defined in the OTFDEC.

The OTFDEC uses AES-128 in counter mode to achieve the lowest possible latency. Each time the content of an encrypted region is changed, the entire region must be re-encrypted with a different cryptographic context (key or initialization vector). This constraint makes the OTFDEC suitable to decrypt read-only data or code, stored in external NOR flash memory.

3.26 Octo-SPI I/O manager (OCTOSPIM)

The OCTOSPIM is an internal multiplexer:

- Efficient OCTOSPI pin assignment by allowing pin swapping
- Multiplexing two single-, dual-, quad, or octal-SPI interfaces over the same external bus: interfaces (with for example different security attributes) share then the same memory, or access two memories embedded in a multichip package.

3.27 Analog-to-digital converters (ADC1/2/3)

STM32MP25xC/F devices embed three analog-to-digital converters, which resolution can be configured to 12, 10, or 8 bits. Each ADC shares up to 20 channels, performing conversions in single-shot or scan mode. In scan mode, an automatic conversion is performed on a selected group of analog inputs.

Additional logic functions embedded in the ADC interface allow:

- simultaneous ADC1/ADC2 conversion
- interleaved ADC1/ADC2 conversion

The ADC can be served by DMA, thus allows the automatic transfer of ADC converted values to a destination location without any software action.

In addition, an analog watchdog feature can accurately monitor the converted voltage of one, some, or all selected channels. An interrupt is generated when the converted voltage is outside the programmed thresholds.

In order to synchronize A/D conversion, the ADCs can be triggered by timers.

3.28 Digital temperature sensor (DTS)

The DTS is a high-precision low-power junction temperature sensor, based on a configurable controller plus one or multiple embedded temperature sensors. The sensor can operate in two distinct modes to provide temperature readings:

- First mode used to provide calibrated accurate temperature
- Second mode that does not require any calibration

Main features:

- Two programmable (rise or fall) hardware alarms incorporating hysteresis
- Status registers recording the minimum and maximum data values received
- A power-up timer with IRQ to support manual operation
- A calibration sequence requiring no knowledge of die temperature.

3.29 V_{BAT} operation

The V_{SW} domain supplies the RTC, the TAMP, the LSI, the LSE, the IWDG5, the backup registers, the LPSPRAM1, the retention RAM, and the backup SRAM.

In order to optimize the battery duration, this power domain is supplied by V_{DD} when available, or by the voltage applied on VBAT pin (when V_{DD} supply is not present). V_{BAT} power is switched when the PDR detects that V_{DD} has dropped below the PDR level.

The voltage on VBAT pin can be provided by an external battery, by a supercapacitor, or directly by V_{DD}. In the latter case, V_{BAT} mode is not functional.

V_{BAT} operation is activated when V_{DD} is not present.

Note: None of these events (external interrupts, watchdog reset, TAMP event, or RTC alarm/events) can directly restore the V_{DD} supply, and force the device out of the V_{BAT} operation. Nevertheless, watchdog reset (taken as a tamper event), TAMP events, and RTC alarm/events can be used to generate a signal to an external circuitry (typically a PMIC) that can restore the V_{DD} supply.

3.30 Voltage reference buffer (VREFBUF)

STM32MP25xC/F devices embed a voltage reference buffer which can be used as voltage reference for ADC, and as voltage reference for external components through VREF+ pin.

An external voltage reference must be provided through the VREF+ pin when the internal voltage reference buffer is off.

3.31 Multifunction digital filter (MDF1)

The MDF is a high-performance module dedicated to the connection of external sigma-delta ($\Sigma\Delta$) modulators.

3.31.1

Features

- 8 serial digital inputs:
 - Configurable SPI interface to connect various digital sensors
 - Configurable Manchester coded interface support
 - Compatible with PDM interface to support digital microphones
- 2 common clocks input/output for $\Sigma\Delta$ modulator(s)
- Flexible matrix (BSMX) for connection between filters and digital inputs
- 2 inputs for connecting internal ADCs
- 8 flexible digital filter paths, including
 - A Configurable CIC filter:
 - Can be split into 2 CIC filters: high resolution filter, and out-of limit detector
 - Can be configured in Sinc⁴ filter
 - Can be configured in Sinc⁵ filter
 - Adjustable decimation ratio
 - A reshape filter to improve the out-of band rejection and in-band ripple
 - A high pass filter to cancel the DC offset
 - An offset error cancellation
 - Gain control
 - Saturation blocks
 - An out-of limit detector
- Short-circuit detector,
- Clock absence detector
- 16 or 24-bit signed output data resolution,
- Continuous or single conversion,
- Possibility to delay independently each bitstream
- Various trigger possibilities
- Break generation on out-of limit or short-circuit detector events
- Autonomous functionality in Stop modes
- DMA can be used to read the conversion data
- Interrupts services

Targeted applications:

- Audio: speech capture
- Motor control
- Metering

3.32

Audio digital filter (ADF1)

The audio digital filter (ADF) is a high-performance module dedicated to the connection of external $\Sigma\Delta$ modulators.

3.32.1

Features

- 1 serial digital input:
 - configurable SPI interface to connect various digital sensors
 - configurable Manchester coded interface support
 - compatible with PDM interface to support digital microphones
- 2 common clocks input/output for $\Sigma\Delta$ modulators

- 1 flexible digital filter paths, including:
 - A MCIC filter configurable in Sinc4 or Sinc5 filter with an adjustable decimation ratio
 - A reshape filter to improve the out-of-band rejection and in-band ripple
 - A high pass filter to cancel the DC offset
 - Gain control
 - Saturation blocks
- Clock absence detector
- Sound activity detector
- 4-bit signed output data resolution
- Continuous or single conversion
- Possibility to delay the selected bitstream
- One trigger input
- Autonomous functionality in Stop modes
- DMA can be used to read the conversion data
- Interrupts services

Targeted applications:

- Audio: speech capture
- Metering

3.33 Digital camera interface (DCMI)

The devices embed a camera interface that can connect with camera modules and CMOS sensors through an 8- to 14-bit parallel interface, to receive video data. The camera interface can support a resolution of 1 Mpixel at 15 fps.

- Programmable polarity for the input pixel clock and synchronization signals
- Parallel data communication can be 8-, 10-, 12-, or 14-bit
- 8-bit progressive video monochrome or RawBayer format, YCbCr 4:2:2 progressive video, RGB 565 progressive video or compressed data (like JPEG)
- Continuous mode or snapshot (a single frame) mode
- Capability to automatically crop the image

3.34 Parallel synchronous slave interface (PSSI)

The PSSI and the DCMI use the same circuitry. These two peripherals cannot be used at the same time: when using the PSSI, DCMI registers cannot be accessed, and vice versa.

The PSSI and the DCMI also share the same alternate functions and interrupt vector.

The PSSI is a generic synchronous 8/16-bit parallel data input/output slave interface. It enables the transmitter to send a data valid signal. This signal indicates when the data is valid, and the receiver to output a flow control signal that indicates when it is ready to sample the data.

Main features:

- Slave mode operation
- 8-bit or 16-bit parallel data input or output
- 8-word (32-byte) FIFO
- Data enable (PSSI_DE) alternate function input, and Ready (PSSI_RDY) alternate function output

3.35 Digital camera interface with pixel processing (DCMIPP)

- Parallel input interface:
 - Up to 16 bits at 120 MHz, up to 2 Mpixel sensors at 30 fps
 - Pixel format: RGB565, 888, YUV422, RawBayer/Mono 8/10/12/14

- When connected to CSI-2 input interface:
 - Up to 200 Mpixel/s, up to 5 Mpixel sensors at 30 fps, supports MIPI CSI-2 v1.3
 - Pixel format: all MIPI CSI-2 v1.3: RGB565, 888, YUV422, RawBayer
 - Features: interleaved packets, 4 virtual channels
- Flow selection and frame control
- Byte-to-pixel conversion
- Statistic removal
- Bad pixel removal (automatic detection and correction of bad pixels from sensor array)
- Decimation of one pixel every 1/2/4/8
- Integrated image processing used to connect low-cost camera module without any embedded ISP
 - Color conversion to adapt to the sensor and tune the Illumination
 - Contrast enhancement
 - RawBayer to RGB conversion (demosaicing)
 - Exposure control
 - Statistics extraction
- Decimation on pipe 0 (pipe dump)
- Multiple pipelines for parallel applications:
 - Pipe0 (for data dump), for a direct dump without processing
 - Pipe1 (for main use), with downsize, color conversion, YUV-planar
 - Pipe2 (for ancillary use), with downsize, color conversion, YUV-planar
- Downsize
 - Box-filtering, with any decimal ratio, up to 8x8, on pipe1 and pipe2
- Gamma conversion
- RGB to YUV color conversion
- Output pixel format:
 - Pipe0: any data as is, Y/Rb: 8/10/12/14 statistics, bitstreams
 - Pipe2: RGB888, RGB565, YUV422-1, Y8, ARGB and RGBA (co-planar only)
 - Pipe1: Pipe2 formats + YUV422-2, YUV420-2, YUV420-3 (multi-planar possible)
- AXI master

3.36 Camera serial interface (CSI)

The CSI provides an interface between the system and the PHY, allowing communication with a CSI-2 compliant camera.

- Compliant with MIPI Alliance standard v1.3
- Up to two data lanes, up to 2.5 Gbit/s per lane in high-speed (HS) mode and 10 Mbit/s in low-power (LP) mode
- Data transmission in HS and LP modes
- Escape mode (ESC), and ultra-low-power state mode (ULPS)
- CSI-2 virtual channel and data type filtering supporting interleaved data
 - Up to 4 virtual channels
 - Support data formats specified in the MIPI Alliance standard for CSI-2 v1.3 (18 data formats, plus the user defined one, up to 7 independent data types)
- Internal connection with the DCMIPP

3.37 LCD-TFT display controller (LTDC)

The LTDC handles display composition and rotation, with the following main features:

- 3 display layers with dedicated FIFO
- Input pixel flexible format, including YUV420 full-planar
- Secure layer: protected access to buffer and configuration registers
- Output rotation: 90 and 270 degrees

- Horizontal and vertical mirror
- Color lookup-table, color keying, gamma, and dithering on output

LTDC parallel interface:

- Provides a 24-bit parallel digital RGB, and delivers all signals to interface directly to a broad range of LCD and TFT panels.
- Up to 150 Mpixel/s, which correspond up to FHD (1920 × 1080) at 60 fps resolution with HDMI blankings
- Output pixel formats: RGB888, RGB666, RGB565, YUV422-16 bits

LTDC DSI interface:

- The LTDC provide pixels to the display serial interface (DSI).

LTDC LVDS interface:

- The LTDC provide pixels to the LVDS display interface (LVDS).

3.38 Display serial interface (DSI)

Note: Features may be limited or absent in some devices or packages (see [Section 2: Description for details](#)).

The DSI is part of a group of communication protocols defined by the MIPI Alliance. The MIPI DSI host controller is a digital core that implements all protocol functions defined in the MIPI DSI specification.

It provides an interface between the system and the MIPI D-PHY that allows the communication with a DSI-compliant display.

- Compliant with MIPI Alliance standards
- Interface with MIPI D-PHY
- Supports all commands defined in the MIPI Alliance specification for DCS
- Bidirectional communication and escape mode support through data lane 0
- Supports non-continuous clock in D-PHY clock lane for additional power saving
- Supports ultra-low-power mode with PLL disabled
- ECC and checksum capabilities
- Support for end of transmission packet (EoTp)
- Fault recovery schemes
- Configurable selection of system interfaces:
 - AMBA APB for control and optional support for generic and DCS commands
 - Video mode interface through LTDC
 - Adapted command mode interface through LTDC
 - Independently programmable virtual channel ID in video mode, adapted command mode and APB slave
- Video mode interface features:
 - LTDC interface color coding mappings into 16, 18 and 24-bit interface
 - Programmable polarity of all LTDC interface signals
- Adapted interface features:
 - Support for sending large amounts of data through the memory_write_start (WMS) and memory_write_continue (WMC) DCS commands
 - LTDC interface color coding mappings into 16, 18 and 24-bit interface
- Video mode pattern generator
- Up to 4 × data lanes, up to 2.5 Gbit/s each
- Up to QXGA (2048 × 1536) at 60 fps

3.39 LVDS display interface (LVDS)

Note: Features may be limited or absent in some devices or packages (see [Section 2 for details](#)).

The LVDS supports the following high-level features:

- FPD-Link-I and OpenLDI (v0.95) protocols
- Single-link or dual-link operation
- Single-display or double-display (with the same content duplicated on both)
- Flexible bit-mapping, including JEIDA and VESA
- RGB888 or RGB666 output
- Up to 2 links of 4 data lanes, up to 1.1 Gbit/s per lane
 - FPD bitrate: 784 Mbit/s per lane (112 Mpixel/s per link, 224 Mpixel/s if dual Link)
 - OpenLDI bitrate: 1100 Mbit/s per lane (157 Mpixel/s per link, 314 Mpixel/s if dual link)
- Up to QXGA (2048 × 1536) at 60 fps with dual link
- Up to WSXGA+ (1680 × 1050) at 60 fps with single FPD link (1080p60 supported with OpenLDI)

3.40 Video encoder (VENC)

Note: *Features may be limited or absent in some devices or packages (see [Section 2](#) for details).*

- Video encode
 - H264 (MPEG4_Part10/AVC, baseline/main/high up to 5.2), VP8
 - Up to 1080p60 for H264/VP8 (performance shared with the VDEC)
- Still-image encode
 - JPEG (baseline interleaved)
 - Up to 500 Mpixel/s for JPEG (performance shared with the VDEC)
- VDERAM
 - 128 Kbytes
 - Hardware handshake between VENC and VDEC
 - Can be statically assigned to CPU as additional system RAM by SYSCFG setting

3.41 Video decoder (VDEC)

Note: *Features may be limited or absent in some devices or packages (see [Section 2](#) for details).*

- Video decode
 - H264 (MPEG4_Part10/AVC, baseline/main/high up to 5.2), VP8
 - Up to 1080p60 for H264/VP8 (performance shared with the VENC)
- Still-image decode
 - JPEG (baseline interleaved).
 - Up to 500 Mpixel/s for JPEG (performance shared with the VENC)
- VDERAM
 - 128 Kbytes
 - Hardware handshake between VENC and VDEC
 - Can be statically assigned to CPU as additional system RAM by SYSCFG setting

3.42 True random number generator (RNG)

All devices embed an RNG that deliver s 32-bit random numbers generated by an integrated analog circuit.

3.43 Hash processor (HASH)

The HASH is a fully compliant implementation of the secure hash algorithm (SHA-1, SHA-2 family, SHA-3 family), and the HMAC (keyed-hash message authentication code) algorithm. The HMAC is suitable for applications that require a message authentication.

The HASH computes FIPS (federal information processing Standards) approved digests of 160-, 224-, 256-, 384-, and 512-bit length, for messages of any length:

- less than 2^{64} bits (for SHA-1, SHA-224, and SHA-256)
- less than 2^{128} bits (for SHA-384, SHA-512)

3.44 Cryptographic processor (CRYP1/2)

The devices embed two cryptographic processor that can be used both to encrypt and decrypt data using the DES, triple-DES, or AES algorithms. The implementation is fully compliant with the following standards:

- DES and TDES are defined by FIPS (PUB 46-3, Oct 1999), and by the American National Standards Institute (ANSI X9.52)
- AES is defined by FIPS (FIPS PUB 197, Nov 2001)

Multiple key sizes and chaining modes are supported:

- DES/TDES chaining modes ECB and CBC, supporting standard 56-bit keys with 8-bit parity per key
- AES chaining modes ECB, CBC, CTR, GCM, GMAC, CCM for key sizes of 128, 192, or 256 bits

The CRYP in AES mode supports key sharing from SAES co-processor. It is a 32-bit AHB peripheral with DMA support for incoming and outgoing data.

The CRYP also includes input and output FIFOs (each 8 words deep) for better performance.

3.45 Secure AES (SAES)

The SAES encrypts or decrypts data, using an algorithm and implementation fully compliant with the AES standard. It implements embedded protection against differential power analysis (DPA) and related side-channel attacks.

The SAES supports CTR, GCM, GMAC, CCM, ECB, and CBC chaining modes for key sizes of 128 or 256 bits, as well as special modes such as hardware secret key encryption/decryption (wrapped-key mode) and key sharing with faster CRYP peripheral (shared-key mode).

The SAES can load directly two hardware master keys that are not directly accessible by any software. These keys can be used to encrypt random keys that are usable only on this device, and are not directly accessible by software.

The SAES supports DMA single transfers for incoming and outgoing data (two DMA channels required). It is connected by hardware to the RNG and to the CRYP1/2.

The SAES is an AMBA AHB slave peripheral.

3.46 Public key accelerator (PKA)

The PKA is intended for the computation of cryptographic public key primitives, specifically those related to RSA, Diffie-Hellmann, or ECC (elliptic curve cryptography) over GF(p) (Galois fields). To achieve high performance at a reasonable cost, these operations are executed in the Montgomery domain.

For a given operation, all needed computations are performed within the accelerator: no further hardware/software elaboration is needed to process inputs or outputs.

3.47 Boot and security and OTP control (BSEC)

The BSEC is used to control an OTP (one-time programmable) fuse box, used for embedded non-volatile storage for device configuration and security parameters.

Embedded non-volatile secrets are stored in the BSEC upper area that is only accessible while BSEC is operating in a closed state. In open state those non-volatile secrets are permanently hidden.

The BSEC use is reserved to trusted domain CPU, and boot CPU following a BSEC reset (cold/warm or hot).

3.48 Timers and watchdogs

The devices include three advanced-control timers, twelve general-purpose timers, two basic timers, five low-power timers, seven watchdogs, two SysTick timers in Cortex-M33, one SysTick timer in Cortex-M0+, and four system timers in each Cortex-A35.

All timer counters can be frozen in debug mode.

The table below compares features of the different timers.

Table 7. Timer feature comparison

Timer type	Timer	Counter resolution	Counter type	Prescaler factor	DMA request generation	Capture/compare channels	Complementary output	Max interface clock (MHz)	Max ⁽¹⁾ timer clock (MHz)
Advanced-control	TIM1, TIM8, TIM20	16-bit	Up, down, up/down	Any integer between 1 and 65536	Yes	6	4	200	200
General purpose	TIM2, TIM3, TIM4, TIM5	32-bit	Up, down, up/down	Any integer between 1 and 65536	Yes	4	No	200	200
	TIM10, TIM11, TIM13, TIM14	16-bit	Up	Any integer between 1 and 65536	No	1	No	200	200
	TIM12	16-bit	Up	Any integer between 1 and 65536	No	2	No	200	200
	TIM15	16-bit	Up	Any integer between 1 and 65536	Yes	2	1	200	200
	TIM16, TIM17	16-bit	Up	Any integer between 1 and 65536	Yes	1	1	200	200
	TIM6, TIM7	16-bit	Up	Any integer between 1 and 65536	Yes	0	No	200	200
Low-power	LPTIM1, LPTIM2	16-bit	Up, Up/down	1, 2, 4, 8, 16, 32, 64, 128	Yes	2 ⁽²⁾	No	200	100
	LPTIM3, LPTIM4	16-bit	Up	1, 2, 4, 8, 16, 32, 64, 128	Yes	2 ⁽²⁾	No	200 ⁽³⁾	100 ⁽⁴⁾
	LPTIM5	16-bit	Up	1, 2, 4, 8, 16, 32, 64, 128	No	0	No	200 ⁽³⁾	100

1. The maximum timer clock depends on RCC settings.
2. only compare channel.
3. 16 MHz bus clock when supplied by the backup regulator (LP-Stop1/2, LPLV-Stop1/2 or Standby1).
4. 32 kHz timer clock in autonomous mode (Stop1/2, LP-Stop1/2, LPLV-Stop1/2 or Standby1).

3.48.1 Advanced-control timers (TIM1/8/20)

The advanced-control timers can be seen as three-phase PWM generators multiplexed on six channels. They have complementary PWM outputs with programmable inserted dead times. They can also be considered as complete general-purpose timers. Their four independent channels can be used for:

- input capture
- output compare
- PWM generation (edge- or center-aligned modes)
- one-pulse mode output

If configured as standard 16-bit timers, the advanced-control timers have the same features as the general-purpose timers. If configured as 16-bit PWM generators, they have full modulation capability (0 to 100%). The advanced-control timers can work together with general-purpose timers via the timer link feature for synchronization or event chaining.

TIM1, TIM8 and TIM20 support independent DMA request generation.

3.48.2 General-purpose timers (TIM2/3/4/5/10/11/12/13/14/15/16/17)

There are twelve synchronizable general-purpose timers embedded in STM32MP25xC/F devices (see Table 7 for differences).

- **TIM2, TIM3, TIM4, TIM5**

These timers are based on a 32-bit auto-reload up/downcounter and a 16-bit prescaler. They feature four independent channels for input capture/output compare, PWM, or one-pulse mode output. This gives up to 16 input capture/output compare/PWMs on the largest packages.

These timers can work together, or with the other general-purpose timers and the advanced-control timers TIM1, TIM8 and TIM20, via the timer link feature for synchronization or event chaining.

Any of these general-purpose timers can be used to generate PWM outputs.

TIM2, TIM3, TIM4, TIM5 have independent DMA request generation. They can handle quadrature (incremental) encoder signals, and the digital outputs from one to four hall-effect sensors.

- **TIM10, TIM11, TIM12, TIM13, TIM14, TIM15, TIM16, TIM17**

These timers are based on a 16-bit auto-reload upcounter and a 16-bit prescaler. TIM10, TIM11, TIM13, TIM14, TIM16 and TIM17 feature one independent channel, whereas TIM12 and TIM15 have two independent channels for input capture/output compare, PWM, or one-pulse mode output. They can be synchronized with the TIM2, TIM3, TIM4, TIM5 full-featured general-purpose timers or used as simple timebases.

3.48.3 Basic timers (TIM6/TIM7)

These timers are used as a generic 16-bit time base, and support independent DMA request generation.

3.48.4 Low-power timer (LPTIM1/2/3/4/5)

These low-power timers have an independent clock and run in Stop mode if they are clocked by LSE, LSI, or an external clock. They can wake up the device from Stop mode.

- 16-bit up counter with 16-bit autoreload register
- 16-bit compare register
- Configurable output: pulse, PWM
- Continuous/one-shot mode
- Selectable software/hardware input trigger
- Selectable clock source:
 - Internal clock source: LSE, LSI, HSI (RCC flexgen output)
 - External clock source over LPTIM input (working even with no internal clock source running, used by the pulse counter application)
- Programmable digital glitch filter
- Encoder mode (LPTIM1/2)

3.48.5 Independent watchdog (IWDG1/2/3/4/5)

The IWDG is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from an independent 32 kHz internal RC (LSI). As it operates independently from the main clock, the IWDG can operate in Stop and Standby modes. It can be used either as a watchdog to reset the device when a problem occurs, or as a free-running timer for application timeout management. It is hardware- or software-configurable through the option bytes.

3.48.6 System window watchdog (WWDG1/2)

The WWDG is based on a 7-bit downcounter that can be set as free-running. It can be used as a watchdog to reset the device when a problem occurs. It is clocked from the APB clock. It has an early warning interrupt capability and the counter can be frozen in debug mode.

3.48.7 SysTick timer

This timer is embedded in the Cortex-M33 (two instances, secure and non-Secure), and in the Cortex-M0+ core. It is dedicated to real-time operating systems, but can also be used as standard downcounter.

- 24-bit downcounter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0

- Programmable clock source

3.48.8 Cortex-A35 generic timers (CNT)

The Cortex-A35 generic timers are fed by value from system timing generation (STGEN). The Cortex-A35 processor provides a set of four timers for each processor:

- Physical timer for use in secure and non-secure modes. The registers for the physical timer are banked to provide secure and non-secure copies.
- Virtual timer for use in non-secure mode
- Physical timer for use in hypervisor mode

These generic timers are not memory-mapped peripherals: they are accessible only by specific Cortex-A35 coprocessor instructions (cp15).

3.49 System timer generation (STGEN)

The STGEN generates a time-count value that provides a consistent view of time for all Cortex-A35 generic timers.

- 64-bit wide to avoid roll-over issues
- Starts from zero or a programmable value
- control APB interface (STGENC) that enables the timer to be saved and restored across power-down events
- Read-only APB interface (STGENR) that enables the timer value to be read by nonsecure software and debug tools
- Timer value incrementing that can be stopped during system debug

3.50 Real-time clock (RTC)

The RTC provides an automatic wake-up to manage all low-power modes. It is an independent BCD timer/counter that provides a time-of-day clock/calendar with programmable alarm interrupts.

The RTC includes also a periodic programmable wake-up flag with interrupt capability.

After backup domain reset, all RTC registers are protected against possible parasitic write accesses.

As long as the supply voltage remains in the operating range, the RTC never stops, regardless of the device status (Run mode, low-power mode, or under reset).

- Calendar with subseconds, seconds, minutes, hours (12 or 24 format), day (day of week), date (day of month), month, and year
- Daylight saving compensation programmable by software
- Programmable alarm with interrupt function. The alarm can be triggered by any combination of the calendar fields.
- Automatic wake-up unit that generates a periodic flag that triggers an automatic wake-up interrupt
- Reference clock detection: a more precise second source clock (50 or 60 Hz) can be used to enhance the calendar precision.
- Accurate synchronization with an external clock using the subsecond shift feature
- Digital calibration circuit (periodic counter correction): 0.95 ppm accuracy, obtained in a calibration window of several seconds
- Timestamp function for event saving
- Maskable interrupts/events:
 - Alarm A
 - Alarm B
 - Wake-up interrupt
 - Timestamp
- TrustZone support:
 - RTC fully securable
 - Alarm A, alarm B, wake-up timer and timestamp individual secure or non-secure configuration

3.51 Tamper and backup registers (TAMP)

The 128 x 32-bit backup registers are retained in all low-power modes, and in V_{BAT} mode. They can be used to store sensitive data as their content is protected by a tamper detection circuit. 16 tamper pins (eight input and eight outputs), and 14 internal tampers are available for anti-tamper detection.

The eight external tamper pins can be configured for edge detection, edge and level, level detection with filtering, or up to eight active tamper which increases the security level by auto-checking that tamper pins are not externally opened or shorted.

- 128 backup registers (TAMP_BKPxR) implemented in the RTC domain that remains powered-on by V_{BAT} when the V_{DD} power is switched off
- 8 external tamper detection events:
 - Each external event can be configured to be active or passive.
 - External passive tampers with configurable filter and internal pull-up
- 14 internal tamper events
- Any tamper detection can generate an RTC timestamp event.
- Any tamper detection erases backup registers.
- TrustZone support:
 - Tamper secure or non-secure configuration
 - Backup registers configuration in three configurable-size areas:
 - 1 read/write secure area
 - 1 write secure/read non-secure area
 - 1 read/write non-secure area
- Monotonic counter

3.52 Inter-integrated circuit interface (I2C1/2/3/4/5/6/7/8)

STM32MP25xC/F devices embed eight I²C interfaces that handle communications between the device and the serial I²C bus. Each I²C interface controls all I²C bus-specific sequencing, protocol, arbitration, and timing.

The I²C peripheral supports:

- I²C-bus specification and user manual rev. 5 compatibility:
 - Controller and target modes, multi-controller capability
 - Standard-mode (Sm), with a bitrate up to 100 Kbit/s
 - Fast-mode (Fm), with a bitrate up to 400 Kbit/s
 - Fast-mode Plus (Fm+), with a bitrate up to 1 Mbit/s and 20 mA output drive I/Os
 - 7-bit and 10-bit addressing mode, multiple 7-bit target addresses
 - Programmable setup and hold times
 - Optional clock stretching
- System management bus (SMBus) specification rev 2.0 compatibility:
 - Hardware PEC (packet error checking) generation and verification with ACK control
 - Address resolution protocol (ARP) support
 - SMBus alert
- Power system management protocol (PMBus) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources that allows the I²C communication speed to be independent from the PCLK reprogramming
- Wake-up from Stop mode on address match
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

3.53 Improved inter-integrated circuit (I3C1/2/3/4)

STM32MP25xC/F devices embed four I³C interfaces, that handle communication between the device and others that are all connected on an I³C bus, like sensors and host processors.

The I3C peripheral implements all required features of the MIPI I3C specification v1.1. It can control all I3C bus-specific sequencing, protocol, arbitration and timing, and can be acting as controller, or as target.

The I3C peripheral, acting as controller, improves the I2C interface features still preserving some backward compatibility: it allows an I2C target to operate on an I3C bus in legacy I2C fast-mode (Fm) or legacy I2C fast-mode plus (Fm+), provided that this latter does not perform clock stretching.

The I3C peripheral can be used with DMA in order to off-load the CPU.

- MIPI I3C specification v1.1 (see I3C section in the reference manual), as:
 - I3C primary controller
 - I3C secondary controller
 - I3C target
- Registers configuration from the host application via the APB slave port
- Queued transfers:
 - Transmit FIFO (TX-FIFO) for data bytes/words to be transmitted on I3C bus
 - Receive FIFO (RX-FIFO) for received data bytes/words on I3C bus
 - Control FIFO (C-FIFO) for control words to be sent on I3C bus, when controller
 - Status FIFO (S-FIFO) for status words as received on I3C bus, when controller
 - For each FIFO, optional DMA mode with a dedicated DMA channel
- Messages:
 - Legacy I2C read/write messages to legacy I2C targets in Fm/Fm+
 - I3C SDR read/write private messages
 - I3C SDR (write) broadcast CCC messages
 - I3C SDR read/write direct CCC messages
- Frame-level management, when controller:
 - Software-triggered or hardware-triggered transfer
 - Optional C-FIFO and TX-FIFO preload
 - Multiple messages encapsulation
 - Optional arbitrable header
- Programmable bus timing, when controller
 - SCL high and low period
 - SDA hold time
 - Bus free (minimum) time (between a stop and a start)
 - Bus available/idle condition time, maximum clock stall time
 - Minimum clock stall time during 9th bit
- Target-initiated requests management:
 - In-band interrupts, with programmable IBI payload (up to 4 bytes)
 - Bus control request, with recovery flow support and hand-off delay
 - Hot-join mechanism
 - Pending read notification
- Bus error management
 - M0, M1, M2, and M3, when controller
 - S0, S1, S2, S3, S4, S5, and S6 when target
 - bus control switch error and recovery
 - target reset
- Separately programmed event/flag generation and management
 - Separated identification and clear control
 - Host application notification via event/flag polling, and/or via interrupt with a programmable enable
 - Error type identification
- Autonomous mode and transfers during Sleep and Stop modes via DMA

- Autonomous wake-up on
 - Target request acknowledge, when controller
 - Missed start detection, when target
 - Reset pattern detection, when target

3.54 Universal synchronous asynchronous receiver transmitter (USART1/2/3/6, UART4/5/7/8/9)

STM32MP25xC/F devices embed four USART and five UART (see [Table 8. USART/UART features](#) for feature summary).

These interfaces provide asynchronous communication, IrDA SIR ENDEC support, multiprocessor communication mode, single-wire half-duplex communication mode, and have LIN master/slave capability. They provide hardware management of CTS and RTS signals, and RS485 driver enable. They can communicate at speeds of up to 12 Mbit/s.

The USARTs embed a 64-byte transmit FIFO (TXFIFO) and a 64-byte receive FIFO (RXFIFO). The FIFO mode is enabled by software, and is disabled by default.

All USARTs provide smartcard mode (ISO 7816 compliant) and SPI-like communication capability. They have a clock domain independent from the CPU clock: this allows the USARTx to wake up the device from Stop mode using baud rates up to 200 Kbaud. Wake-up events from Stop mode are programmable and can be one of the following:

- Start bit detection
- Any received data frame
- A specific programmed data frame

All USARTs can be served by the DMA controller.

Table 8. USART/UART features

Modes/features ⁽¹⁾	USART1/2/3/6	UART4/5/7/8/9
Hardware flow control for modem	X	X
Continuous communication using DMA	X	X
Multiprocessor communication	X	X
Synchronous SPI mode (master/slave)	X	-
Smartcard mode	X	-
Single-wire half-duplex communication	X	X
IrDA SIR ENDEC block	X	X
LIN mode	X	X
Dual clock domain and wake-up from low-power mode	X	X
Receiver timeout interrupt	X	X
Modbus communication	X	X
Auto baud rate detection	X	X
Driver enable	X	X
Data length	7, 8, and 9 bits	

1. X = supported.

3.55 Low-power universal asynchronous receiver transmitter (LPUART1)

The devices embed one LPUART that supports asynchronous serial communication with minimum power consumption. The LPUART supports half-duplex single-wire communication and modem operations (CTS/RTS). It allows multiprocessor communication.

The LPUART embeds a transmit FIFO (TXFIFO) and a receive FIFO (RXFIFO). The FIFO mode is enabled by software, and is disabled by default.

The LPUART has a clock domain independent from the CPU clock, and can wake up the system from Stop mode. The wake-up from Stop mode is programmable, and can be done on one of the following:

- A start bit detection
- Any received data frame
- A specific programmed data frame
- Specific TXFIFO/RXFIFO status when FIFO mode is enabled

Even in Stop mode, the LPUART can wait for an incoming frame while having an extremely low-energy consumption.

The LPUART interface can be served by the LPDMA controller.

3.56 Serial peripheral interface (SPI1/2/3/4/5/6/7/8) inter-integrated sound interfaces (I2S1/2/3)

The devices feature up to eight SPIs that allow communication at up to 50 Mbit/s in master and slave modes, in half-duplex, full-duplex, and simplex modes. The 3-bit prescaler gives eight master mode frequencies, and the frame is configurable from 4 to 16 bits.

All SPI interfaces support NSS pulse mode, TI mode, hardware CRC calculation, and eight 8-bit embedded Rx and Tx FIFOs with DMA capability.

The standard I²S interfaces (multiplexed with SPI1, SPI2 and SPI3) can be operated in master or slave mode, in full-duplex and half-duplex communication modes. They can be configured to operate with a 16-/32-bit resolution as an input or output channel.

Audio sampling frequencies from 8 kHz up to 192 kHz are supported. When either or both I²S interfaces is/are configured in master mode, the master clock can be output to the external DAC/CODEC at 256 times the sampling frequency. All I²S interfaces support 16x 8bit embedded Rx and Tx FIFOs with DMA capability.

3.57 Serial audio interfaces (SAI1/2/3/4)

The devices embed four SAIs that are used to design many stereo or mono audio protocols such as I²S, LSB or MSB-justified, PCM/DSP, TDM, or AC'97. An SPDIF output is available when the audio block is configured as a transmitter. To bring this level of flexibility and reconfigurability, the SAI contains two independent audio subblocks. Each block has its own clock generator and I/O line controller.

Audio sampling frequencies up to 192 kHz are supported.

Up to eight microphones can be supported thanks to an embedded PDM interface.

The SAI can work in master or slave configuration. The audio subblocks can be either receiver or transmitter, and can work synchronously or asynchronously (with respect to the other one). The SAI can be connected with other SAIs to work synchronously.

3.58 SPDIF receiver interface (SPDIFRX)

The SPDIFRX is designed to receive an S/PDIF flow compliant with IEC-60958 and IEC61937. These standards support simple stereo streams up to high sample rate, and compressed multi-channel surround sound, such as those defined by Dolby® or DTS® (up to 5.1).

- Up to 4 inputs available
- Automatic symbol rate detection
- Maximum symbol rate: 12.288 MHz
- Stereo stream from 32 to 192 kHz supported
- Supports audio IEC-60958 and IEC-61937, consumer applications
- Parity bit management
- Communication using DMA for audio samples
- Communication using DMA for control and user channel information
- Interrupt capabilities

The SPDIFRX receiver provides all necessary features to detect the symbol rate, and to decode the incoming data stream. The user can select the wanted SPDIF input, and when a valid signal is available, the SPDIFRX re-samples the incoming signal, decodes the Manchester stream, and recognizes frames, sub-frames, and blocks elements. It delivers to the CPU decoded data, and associated status flags.

The SPDIFRX also offers a signal named `spdif_frame_sync`, which toggles at the S/PDIF sub-frame rate: this signal is used to compute the exact sample rate for clock drift algorithms.

3.59 Secure digital input/output MultiMediaCard interface (SDMMC1/2/3)

Three SDMMCs provide an interface between the AHB bus and SD memory cards, SDIO and eMMC devices. SDMMC features include the following:

- Full compliance with MultiMediaCard System Specification Version 5.1

Card support for three different databus modes: 1-bit (default), 4-bit and 8-bit (HS200 speed limited by maximum allowed I/O speed, HS400 is not supported).

- Full compatibility with previous versions of MultiMediaCards (backward compatibility)
- Full compliance with SD memory card specifications version 6.0 (SDR104 SDMMC_CLK speed limited to maximum allowed I/O speed, SPI and UHS-II modes not supported)
- Full compliance with SDIO card specification version 4.0

Card support for two different databus modes: 1-bit (default) and 4-bit (SDR104 SDMMC_CLK speed limited to maximum allowed I/O speed, SPI and UHS-II modes not supported)

- Data transfer up to 208 Mbyte/s for the 8-bit mode (depending on the maximum allowed I/O speed)
- Data and command output enable signals to control external bidirectional drivers
- The SDMMC host interface embeds a dedicated DMA controller that allows high-speed transfers between the interface and the SRAM.
- IDMA linked list support

Each SDMMC is coupled with a delay block (DLYBSD) that supports an external data frequency above 100 MHz.

3.60 Controller area network (FDCAN1/2/3)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

The CAN subsystem consists of three FDCANs, a shared message RAM, and a clock calibration unit.

All FDCANs are compliant with ISO 11898-1 (CAN protocol specification version 2.0 part A, B), and CAN FD protocol specification version 1.0.

FDCAN1 supports time triggered CAN (TTCAN) specified in ISO 11898-4, including event synchronized time-triggered communication, global system time, and clock drift compensation. The FDCAN1 contains additional registers, specific to the time triggered feature. The CAN FD option can be used together with event-triggered and time-triggered CAN communication.

A 10-Kbyte message RAM implements filters, receives FIFOs, receives buffers, transmits event FIFOs, transmits buffers (and triggers for TTCAN). This message RAM is shared between all FDCANs.

The common clock calibration unit is optional. It can be used to generate a calibrated clock for FDCANs from the HSI internal RC oscillator and the PLL, by evaluating CAN messages received by the FDCAN1.

3.61 Universal serial bus Hi-Speed host (USBH)

The devices embed one USB Hi-Speed host (up to 480 Mbit/s) with one physical port. USBH supports both low, full-speed (OHCI) as well as Hi-Speed (EHCI) operations. It integrates a physical interface (PHY) which can be used for either low-speed (1.2 Mbit/s), full-speed (12 Mbit/s), or Hi-Speed operation (480 Mbit/s).

The USBH is compliant with the USB 2.0 specification.

3.62 USB Type-C Power Delivery controller (UCPD1)

The devices embed one controller compliant with USB Type-C Rev.1.2 and USB Power Delivery Rev. 3.1 specifications.

The UCPD use specific I/Os supporting the USB Type-C and USB Power Delivery requirements, featuring:

- USB Type-C pull-up (R_p , all values) and pull-down (R_d) resistors
- USB Power Delivery message transmission and reception

The digital controller handles notably:

- USB Type-C level detection with de-bounce, generating interrupts
- byte-level interface for USB Power Delivery payload, generating interrupts (DMA compatible)

- USB Power Delivery timing dividers (including a clock pre-scaler)
- CRC generation/checking
- 4b5b encode/decode
- ordered sets (with a programmable ordered set mask at receive)
- frequency recovery in receiver during preamble

The interface offers low-power operation compatible with Stop mode, maintaining the capacity to detect incoming USB Power Delivery messages.

3.63 Universal serial bus 3.0 dual role data (USB3DR)

- 5 Gbit/s PHY (COMBOPHY)
- xHCI model.
- Dual Role Data. The USB3DR can be configured statically as a Host or Device port.
- OTG is not supported:
 - Dynamic switch from Host (resp. Device) to Device (resp. Host) role is not supported.
 - Host Negotiation Protocol (HNP), Role Swap Protocol (RSP), Session Request Protocol (SRP), Attach Detection Protocol (ADP) are not supported.
- USB3 SuperSpeed mode (5 Gbit/s), as well as USB2 Low-Speed/Full-Speed/Hi-Speed modes (when Host) or USB2 Full-Speed/Hi-Speed modes (when Device).
- Descriptor caching and data pre-fetching to meet system performance.
- Variable FIFO buffer allocation for each endpoint.
- Simultaneously 4 Gbit/s IN and 4 Gbit/s OUT bandwidth
- DMA engine
- Supports Battery Charging v1.2, with the exception of the Accessory Charger Adapter mode

The standards supported are:

- Universal Serial Bus 3.0 Specification, Revision 1.0, November 12, 2008
- Universal Serial Bus Specification, Revision 2.0, USB Implementers Forum, Inc., April 27, 2000
- Errata for "USB Revision 2.0 April 27 2000" as of May 28, 2002, USB-IF
- eXtensible Host Controller Interface for Universal Serial Bus (xHCI), Revision 1.1, Intel Corp., December 20, 2013
- UTMI+ Specification, Revision 1.0, ULPI Working Group, February 25, 2004
- Battery Charging Specification, Revision 1.2, December 7, 2010

3.64 PCI Express interface (PCIE)

The PCIE controller has the following features:

- One lane Generation2 PCIe
- Dual-mode (RC or EP)
- PTM
- 256-byte maximum payload size
- Remote device maximum read request size 1K Byte
- Single Virtual Channel
- Single Function
- Legacy INTx support, MSI and GICv2m host support
- ASPM L0s and L1, and L1.1 substate
- AER
- Internal ATU
- 5 Gbit/s PHY (COMBOPHY)

An included PCIe reference clock generator (REFGEN) provides a 100 MHz differential clock to a PCIe link partner. This can be used to eliminate the external 100 MHz clock source that is typically found in PCIe common-clock implementations.

The PCIE internal reference clock is 25 MHz (without SSC). There is also the option of an external PCIE differential reference clock 100 MHz (with SSC).

3.65 5-Gbit/s PHY controller (COMBOPHY)

The COMBOPHY control a 5-Gbit/s multi-protocol PHY, that is used by the USB3DR or the PCIE (mutually exclusive). It supports data rates up to 5 Gbit/s for USB3.0, 5 Gbit/s for PCIe gen2, and 2.5 Gbit/s for PCIe gen1.

The COMBOPHY includes the physical coding sublayer (PCS) blocks that perform 8-/10bit encoding/decoding, and resynchronizing RX data to the local clock domain.

The COMBOPHY is single lane. The SuperSpeed lane multiplexing for USB Type-C must be managed by a switch outside the device.

3.66 Gigabit Ethernet MAC interface (ETH1/2)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

The devices embed two fully independent instances of a 10/100/1000 Ethernet MAC controller, that enable transmission and reception of data over Ethernet, in compliance with IEEE 802.3-2008.

Each Ethernet MAC controller is connected to an external Ethernet PHY via a standard media independent interface.

Features provided by the Ethernet controller include:

- 10, 100, and 1000 Mbit/s data transfer rates
- Full-duplex and half-duplex operations
- Standard or Jumbo Ethernet packets
- Two independent Rx queues and two independent Tx queues, with each queue associated to a (subset of) PCP code(s)
- Configurable media-independent interface to external PHY:
 - RGMII
 - MII
 - RMII
 - MDIO master interface for external PHY device configuration
 - Internal or external reference clocks
- Low-power support:
 - Energy Efficient Ethernet (EEE) compliant with IEEE 802.3az-2010;
 - Detection of LAN wake-up frames and “Magic Packet” frames
- Timing and synchronization:
 - Compliance with IEEE 1588-2008 (PTP) and IEEE 802.1AS-Rev
 - Hardware “auxiliary timestamp trigger” for accurate sampling of the “PTP system clock”
 - Internal or external system time
- Time-sensitive networking:
 - “Forwarding and Queuing Enhancements for Time-Sensitive Streams” compliant with IEEE 802.1Qav
 - “Enhancements to Scheduled Traffic” compliant with IEEE 802.1Qbv, with a gate control list depth up to 128
 - “Frame Preemption” compliant with IEEE 802.1Qbu and IEEE 802.3br
- Preamble and start-of-frame data insertion (for Tx) and deletion (for Rx)
- Option for automatic CRC generation (for Tx), checking and stripping (for Rx)
- Source address field insertion or replacement in transmitted packets
- Filtering options:
 - Perfect match with a given SA/DA (up to 3 MAC addresses are supported)
 - 64-bit Hash filter match
 - Several multicast/broadcast rules supported
 - Based on IEEE 802.1q ‘VLAN tag’ field (perfect match, hash filtering)
 - Support for different ‘VLAN tag’ filtering for each Rx queue
 - Based on TCP/UDP/IP address (perfect match, inverse filtering)

- TCP/IP offloading:
 - Checksum calculation and insertion in the transmit path
 - Checksum error detection in the receive path.
 - TCP segmentation offload (automatic split of a large TCP packet into smaller Ethernet frames)

3.67 Gigabit Ethernet switch (ETHSW)

Note: Features may be limited or absent in some devices or packages (see [Section 2](#) for details).

A 3-port gigabit Ethernet switch is included. The switch supports TSN and related standards, and also includes a cut-through accelerator (called ACM) for the two external ports.

Two switch ports are available externally providing RGMII and RMII interfaces. The third port is connected internally to the ETH1 controller.

The switch can be completely bypassed. In this case, ETH1 is connected directly to a single external port.

3.68 Debug infrastructure

The devices offer a comprehensive set of debug and trace features to support software development and system integration.

- Breakpoint debugging
- Code execution tracing
- Software instrumentation
- JTAG debug port
- Serial-wire debug port
- Trigger input and output
- Serial-wire trace port
- Trace port
- Arm CoreSight debug and trace components

The debug can be controlled via a JTAG/serial-wire debug access port, using industry standard debugging tools.

A trace port allows data to be captured for logging and analysis.

4 Pinouts/ballouts, pin description, and alternate functions

4.1 Ballout schematics

Figure 6. STM32MP25xC/F TFBGA361 ballout

DT75886.vsdv1

1. The above figure shows the package top view.
2. VDDGPU, VDDA18DSI, VDDDSI, VDDA18LVDS, and VDDLVDs are DNU on product without the related feature (respectively GPU/NPU, DSI and LVDS) and must be connected to VSS. DSI_xxx and LVDSx_xxx are DNU on product without the related feature (respectively DSI and LVDS) and must be left open. See Section 2 for details on feature availability. Alternatively, for PCB compatibility purposes, those balls could be connected in same ways as for a product with enabled feature. Refer to AN5489 for additional details.

VDD/VSW ⁽⁶⁾⁽⁷⁾	PC3, PC4, PC5, PF6, PF7, PG1, PG3

1. Does not include analog peripherals which have one or more dedicated supplies (for example PHYs).
2. Usually used for SD-Card using SDMMC1.
3. Usually used for eMMC or SD-Card using SDMMC2.
4. Usually used for OCTOSPIM_P1.
5. Usually used for OCTOSPIM_P2.
6. VSW is supplied by V_{BAT} in absence of V_{DD} .
7. Pins with two supplies: V_{SW} supply for enabled TAMP_INx additional function, V_{DD} supply for GPIO and other alternate function.

4.2 Ball description

Table 10. Legend/abbreviations used in the ballout table

Name	Abbreviation	Definition
Pin name		Unless otherwise specified, the function during and after reset is the same as the actual pin/ball name
	DNU (do not use)	Represent a pin/ball that must be left unconnected (open) at application level unless otherwise noted.
Pin type	S	Supply pin
	I	Input only pin
	O	Output only pin
	I/O	Input/output pin
	A	Analog or special level pin
I/O structure	TT(U/D/PD)	3.6 V capable I/O (with fixed pull-up/pull-down/programmable pull-down) ⁽¹⁾
	DDR	1.35 V, 1.2 V, or 1.1 V I/O for DDR3L, DDR4 or LPDDR4 interface
	A	Analog signal
	RST	Reset pin with weak pull-up resistor
	Option for TT I/Os	
	_f ⁽²⁾	I3C option
	_a ⁽²⁾	Analog option (supplied by V _{DDA18ADC} for the analog part of the I/O)
Notes	Unless otherwise specified by a note, all I/Os are set as floating inputs during and after reset	
Alternate functions	Functions selected through GPIOx_AFR registers	
Additional functions	Functions directly selected/enabled through peripheral registers	

1. 3.6 V capable only if related I/O supply is 3.3 V typ. and related VDDIOxVRSEL = 0.

2. The related I/O structures in table below are TT_f, TT_a and TT_af.

Note: Alternate functions listed in following tables may be absent in some devices or packages (see [Section 2](#) for details).

Table 11. STM32MP25xC/F ball definitions

Pin number				Pin name (function after reset)	Pin type	I/O structur e	Notes	Alternate functions	Additional functions

1. Power supply is V_{DD} .
2. ball is DNU in some part numbers.
3. Power supply is V_{DD} - used in open drain with external pull-up.
4. Power supply is V_{DDIO4} .
5. Power supply is V_{DD} or V_{SW} - input only in V_{SW} .
6. Power supply is V_{SW} .
7. Power supply is V_{SW} - OSC32_IN pin is also used as digital input in LSE bypass mode and tied to GPIO PC14 input (for test purpose only).
8. Power supply is V_{SW} - OSC32_OUT pin is also tied to GPIO PC15 input (for test purpose only).
9. Power supply is $V_{DDA18AON}$, must be always connected at board level to $V_{DDA18AON}$.
10. Power supply is V_{DDIO3} .
11. Power supply is V_{DDIO1} .
12. Power supply is V_{DDIO2} .
13. Power supply is $V_{DDA18AON}$ - OSC_IN pin is also used as digital input in HSE bypass mode and tied to GPIO PH0 input (for test purpose only).
14. Power supply is $V_{DDA18AON}$ - OSC_OUT pin is also tied to GPIO PH1 input, used by Boot ROM to autodetect HSE bypass mode.
15. Power supply is V_{DD} or V_{SW} .

4.3 Alternate functions

5 Memory mapping

Refer to the product line reference manual (STM32MP23/25xx reference manual (RM0457)) for details on the memory mapping as well as the boundary addresses for all peripherals.

6 Electrical characteristics

6.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to V_{SS} .

6.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the worst conditions of junction temperature, supply voltage and frequencies by tests in production on 100% of the devices with a junction temperature at $T_J = 25^\circ\text{C}$ and $T_J = T_{J\text{max}}$ (given by the selected temperature range).

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation ($\text{mean} \pm 3\sigma$).

6.1.2 Typical values

Unless otherwise specified, typical data are based on $T_J = 25^\circ\text{C}$, $V_{DD} = 3.3\text{ V}$, $V_{DD\text{CORE}} = 0.82\text{ V}$, $V_{DD\text{CPU}} = 0.8\text{ V}$, $V_{DD\text{GPU}} = 0.8\text{ V}$. They are given only as design guidelines and are not tested in production.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated ($\text{mean} \pm 2\sigma$).

6.1.3 Typical curves

Unless otherwise specified, all typical curves are given only as design guidelines and are not tested.

6.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in Figure 10 .

6.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in Figure 11 .

Figure 10. Pin loading conditions

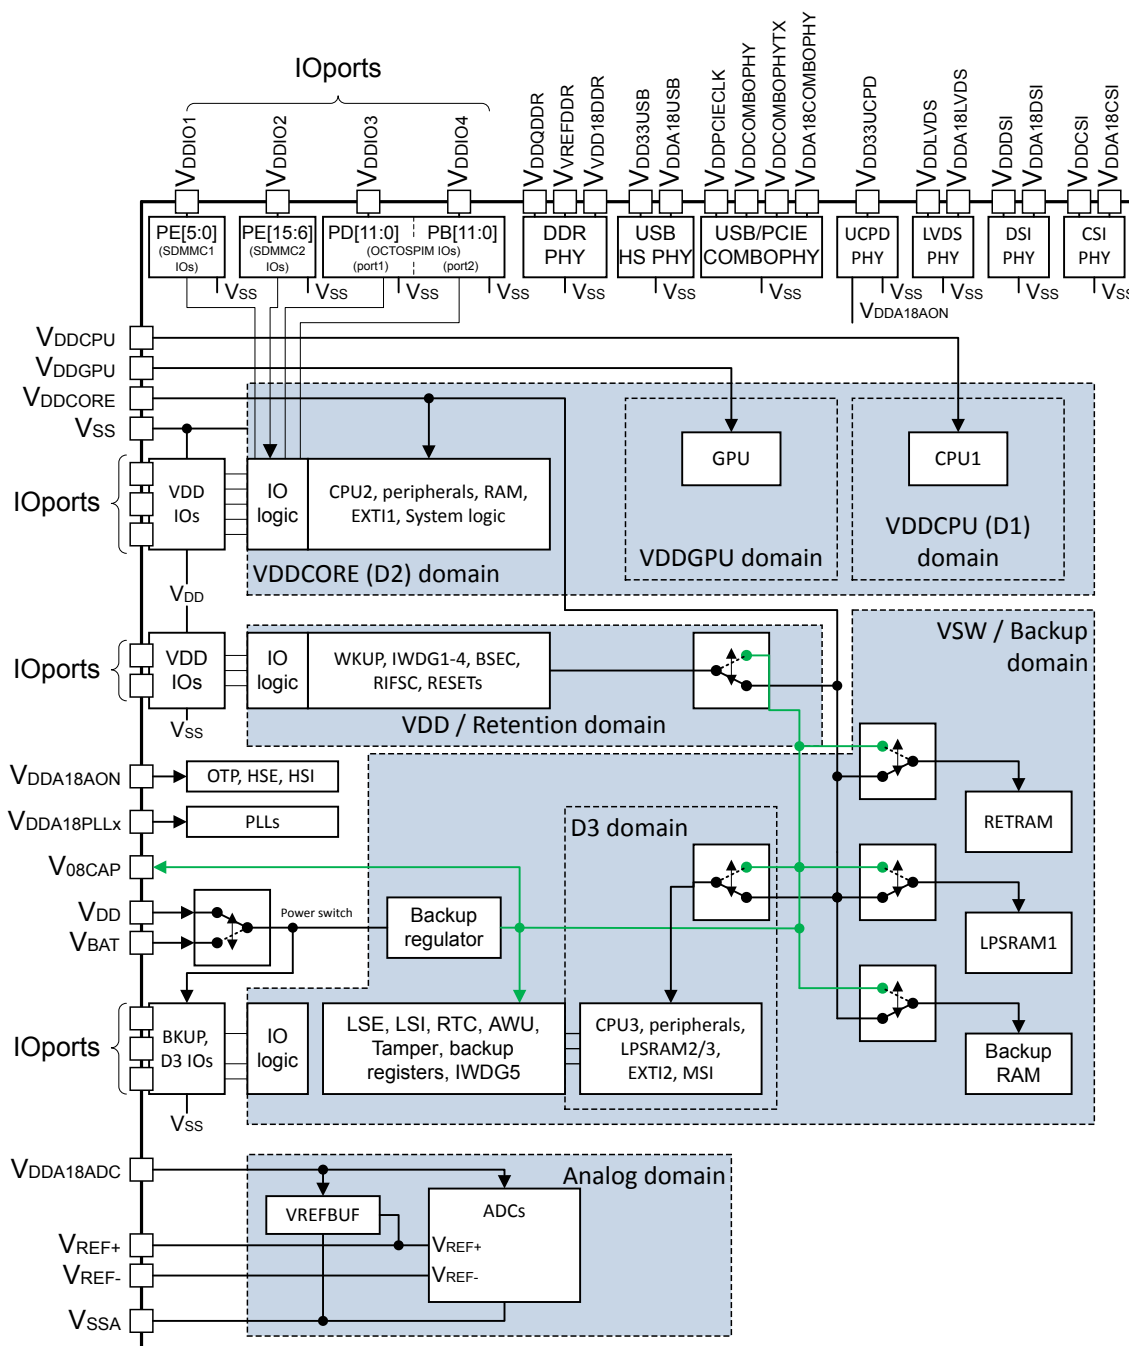

Figure 11. Pin input voltage

6.1.6 Power supply scheme

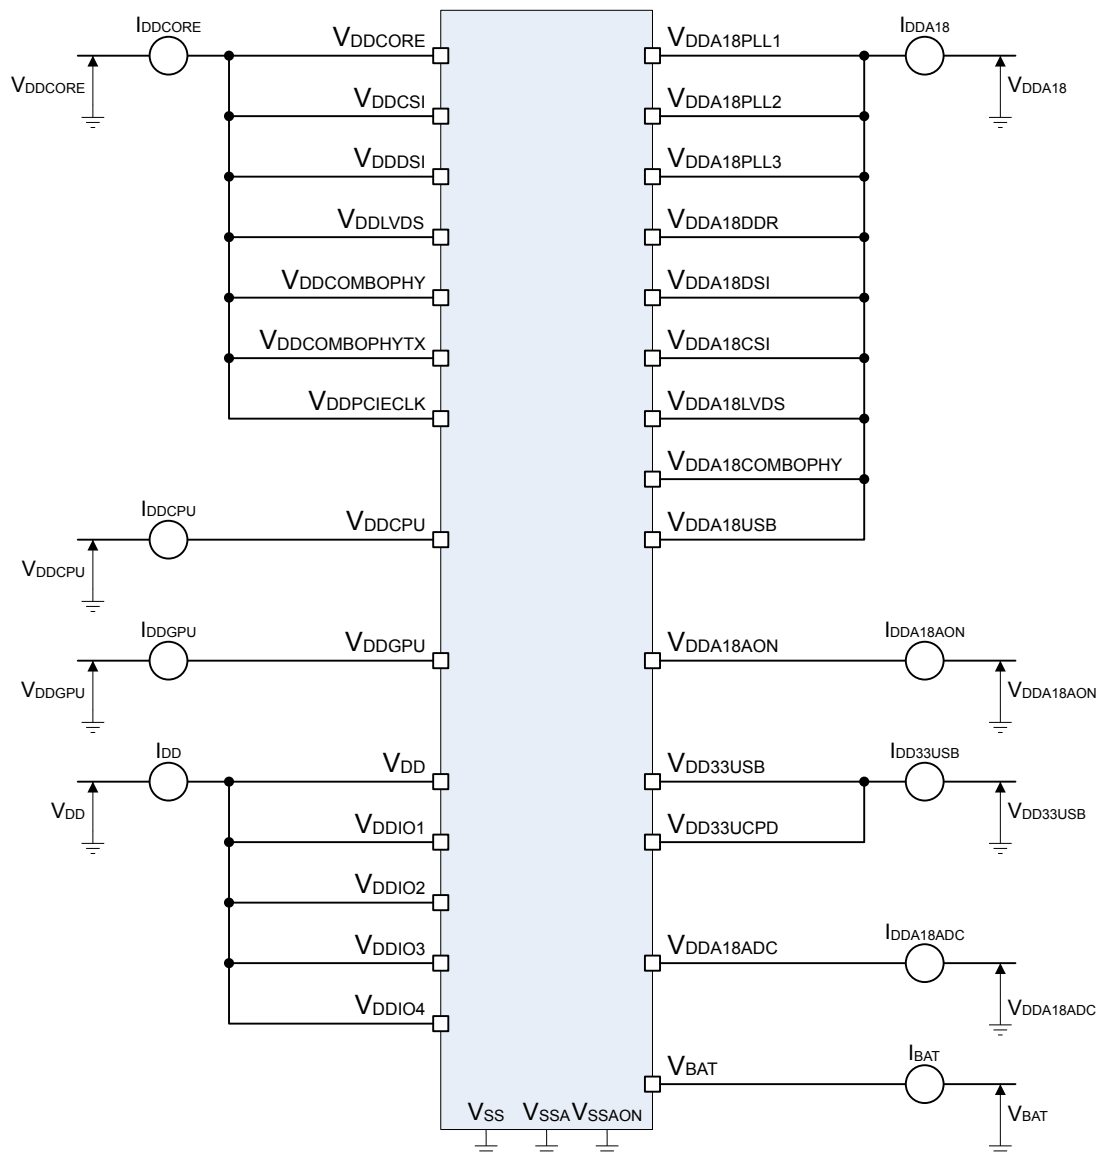

Figure 12. Power supply scheme

Caution: Each power supply pair (V_{DD}/V_{SS} , V_{DDCORE}/V_{SS} , V_{DDA}/V_{SSA} ...) must be decoupled with filtering ceramic capacitors. These capacitors must be placed as close as possible to, or below, the appropriate pins on the underside of the PCB to ensure good operation of the device. It is not recommended to remove filtering capacitors to reduce PCB size or cost. This might cause incorrect operation of the device.

The number of needed capacitances and their values are provided in AN5489 "Getting started with STM32MP25x lines hardware development" available from the ST website www.st.com.

6.1.7 Current consumption measurement

Figure 13. Current consumption measurement scheme

DT74103V1

6.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in Table 14. [Voltage characteristics](#), Table 15. [Current characteristics](#), and Table 16. [Thermal characteristics](#) may cause permanent damage to the device. These are stress ratings only and the functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. Device mission profile (application conditions) is compliant with JEDEC JESD47 qualification standard, extended mission profiles are available on demand.

Table 14. Voltage characteristics

Specified by design, not tested in production.

All powers and grounds pins must always be connected to an external power supply, in the permitted range.

Symbols	Ratings	Min	Max	Unit
$V_{DDX} - V_{SS}$ range 1.8 V	External supply voltage (including V_{DD} , V_{DDIOx} , V_{BAT})	-0.3	2	V
$V_{DDX} - V_{SS}$ range 3.3 V	External supply voltage (including V_{DD} , V_{DDIOx} , V_{BAT} , $V_{DD33USB}$, $V_{DD33UCPD}$)	-0.3	3.7	
$V_{DDCORE} - V_{SS}$	External core supply voltage (including V_{DDCORE} , V_{DDCPU} , V_{DDGPU} , V_{DDCSI} , V_{DDDSI} , V_{DDLVDs} , $V_{DDCOMBOPHY}$, $V_{DDCOMBOPHYTX}$, $V_{DDPCIECLK}$)	-0.3	0.99	
$V_{DDQDDR} - V_{SS}$	DDR IO supply voltage	-0.3	1.575	
$V_{DDA18} - V_{SS}$	1.8 V supply voltage (including $V_{DDA18AON}$, $V_{DDA18PLL1}$, $V_{DDA18PLL2}$, $V_{DDA18PLL3}$, $V_{DDA18DSI}$, $V_{DDA18CSI}$, $V_{DDA18LVDS}$, $V_{DDA18COMBOPHY}$, $V_{DDA18DDR}$, $V_{DDA18USB}$, $V_{DDA18ADC}$)	-0.3	1.98	
$V_{IN}^{(1)}$	Input voltage on TT_xx pins ($V_{DDIOxVRSEL} = 0$)	$V_{SS} - 0.3$	$\min(V_{DDIOx} + 0.3, 3.6)$	
	Input voltage on TT_xx pins ($V_{DDIOxVRSEL} = 1$)		$\min(V_{DDIOx} + 0.3, 1.98)$	
	Input voltage on UCPD pins		$V_{DD3V3_UCPD} + 1.935$	
	Input voltage on USB3DR or USBH_HS DP/DM pins		$\min(V_{DD3V3_USB} + 0.3, 3.6)^{(2)}$	
	Input voltage on COMBOPHY pins		$\min(V_{DDCOMBOPHY} + 0.3, 0.99)$	
	Input voltage on CSI pins		1.35	
$ \Delta V_{DDx} $	Variations between different VDDX power pins of the same domain	-	50	mV
$ V_{SSx} - V_{SS} $	Variations between all the different ground pins	-	50	

1. V_{IN} maximum must always be respected. Refer to next table for the maximum allowed injected current values.

2. When the supply is not present, the IOs tolerate being pulled to 3.5 V maximum through external resistors.

Table 15. Current characteristics

Specified by design, not tested in production.

Symbols	Ratings	Condition	Max	Unit
I_{IO}	Output current sunk/source by any I/O and control pin	$T_J > 110\text{ }^{\circ}\text{C}$	4	mA
		$90\text{ }^{\circ}\text{C} < T_J \leq 110\text{ }^{\circ}\text{C}$	10	
		$-40\text{ }^{\circ}\text{C} < T_J \leq 90\text{ }^{\circ}\text{C}$	20	
$\sum I_{INJ}(PIN)$	Total injected current (sum of all I/Os and control pins)		± 25	

1. When several inputs are submitted to a current injection, the maximum $\sum I_{INJ}(PIN)$ is the absolute sum of the positive and negative injected currents (instantaneous values).

Table 16. Thermal characteristics

Specified by design, not tested in production.

Symbol	Ratings	Value	Unit
T _{STG}	Storage temperature range	-65 to +150	°C
T _J	Maximum junction temperature (suffix 3)	125	

6.3 Operating conditions

6.3.1 General operating conditions

Table 17. General operating conditions

Voltages in this table represent DC value at ball level.

Symbol	Parameter	Operating conditions	Min	Typ	Max	Unit
F _{cpu1}	Clock frequency of Cortex-A35		0	-	1200	MHz
F _{cpu1_overdrive} ⁽¹⁾	Clock frequency of Cortex-A35 in overdrive	STM32MP25xF only	0	-	1500

		I/O when PVD_IN is used			V _{DD3V3_UCPD} + 1.935	
		UCPD IOs			V _{DDQDDR}	
		DDR I/O				
T _J	Junction temperature range	Suffix 3 version	-40	-	125	°C

1. Feature might be limited or absent in some devices or packages. See Table 1 for details.

2. Values depend on the external memory device choice.

3. V_{DDA18AON} and V_{DD} must be present before any other supply.

4. Functional down to 1.71 V if UCPD is not used.
5. Static condition. 1.98 V allowed during transients.
6. Requires $VDDIOVRSEL = 0$.
7. These supplies are independent, that means each one could be in any of the following voltage ranges: 0 V (OFF), 1.8 V, 3 V or 3.3 V.
8. Requires $VDDIOxVRSEL = 0$
9. All these supplies are usually connected together.
10. This is the max allowed voltage, however LPLV-Stop mode is relevant only to save power, so requires voltage as low as possible (that is external regulator set for typical value, then the maximum voltage is few percent above the typical due to regulator accuracy).
11. The $V_{DDA18PLLx}$ must be connected together.
12. Could be connected to other $V_{DDA18xx}$ supplies if min/max range fulfilled.
13. Except when connected to V_{DD} where lower limit is then 1.71 V.
14. This pin is used only to connect a decoupling capacitor for internal backup regulator, this pin must never be used externally for other purposes.
15. V_{DDxx} stands for V_{DD} , V_{DDIO1} , V_{DDIO2} , V_{DDIO3} or V_{DDIO4} .

6.3.2

Operating conditions at power-up / power-down

Subject to general operating conditions.

Constraints on power supply sequences:

- $V_{DDA18AON}$ and V_{DD} must be present before any other supply (except V_{BAT}) and kept present whenever any other supply is present (except V_{BAT}). Damage could occur if not ensured.
- $V_{DDA18AON}$ and V_{DD} must ramp up and ramp down together (within a 1 ms time windows). Damage could occur if not ensured.
- $V_{DDA18USB}$ must be present whenever $V_{DD33USB}$ is present. Damage could occur if not ensured.
- V_{DDCORE} must be present whenever $V_{DDA18USB}$ and/or $V_{DDA33USB}$ are present. If not ensured, leakage could occur on these supplies until V_{DDCORE} is present.

Table 18. Operating conditions at power-up / power-down

Symbol	Parameter	Operating conditions	Min	Max	Unit
$t_{VDDA18AON}$	$V_{DDA18AON}$ transitions	Rise time rate	20	1500	$\mu s/V$
		Fall time rate	20	1500	
t_{VDD}	V_{DD}/V_{DDIOx} transitions	Rise time rate	20	1500	
		Fall time rate	20	1500	
$t_{VDDCORE}$	V_{DDCORE} transitions	Rise time rate	20	1500	
		Fall time rate	25	1500	
$t_{VDDCPU}, t_{VDDGPU}, t_{VDDCSI}, t_{VDDSI}, t_{VDDLVDs}, t_{VDDCOMBOPHY}, t_{VDDCOMBOPHYTX}, t_{VDDPCIECLK}$	$V_{DDCPU}, V_{DDGPU}, V_{DDCSI}, V_{DDSI}, V_{DDLVDs}, V_{DDCOMBOPHY}, V_{DDCOMBOPHYTX}, V_{DDPCIECLK}$ transitions	Rise time rate	10	1500	
		Fall time rate	10	1500	
t_{VDDA18}	$V_{DDA18PLL1}, V_{DDA18PLL2}, V_{DDA18PLL3}, V_{DDA18DSI}, V_{DDA18CSI}, V_{DDA18LVDS}, V_{DDA18COMBOPHY}, V_{DDA18DDR}, V_{DDA18USB}, V_{DDA18ADC}$ transitions	Rise time rate	10	1500	
		Fall time rate	10	1500

T _{delay_VDDCORE}	Delay after detection	Rising edge	180	400	750	µs
		Falling edge	-	0	-	
I _{RDY_VDDCORE(VDDA18AON)}	Supply current on V _{DDA18AON}	Always ON	-	1.2	-	µA

1. *Guaranteed by test in production.*

6.3.4

Embedded reference voltage

The parameters given in Table 20 and Table 21 are derived from tests performed under ambient temperature and V_{DD} supply voltage conditions summarized in Table 17. [General operating conditions](#).

Table 20. Embedded reference voltage characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V _{REFINT} ⁽¹⁾	Internal reference voltages	-40 °C < T _J < 125 °C	0.792	0.8	0.808	V
t _{S_VREFINT} ⁽²⁾	ADC sampling time when reading the internal reference voltage	-	34	-	-	ns
DV _{REFINT}	Internal reference voltage spread over the temperature range	-40 °C < T _J < 125 °C	-4	-	+4	mV
T _{coeff}	Average temperature coefficient	-40 °C < T _J < 125 °C	-	-	43	ppm/°C
V _{DDcoeff}	Average voltage coefficient	1.71 < V _{DDA18AON} < 1.89	-	-	1250	ppm/V

1. *Guaranteed by test in production.*

2. *Specified by design, not tested in production.*

Table 21. Embedded reference voltage calibration value

Symbol	Parameter	Memory address
VREFINT_CAL	Raw data acquired on ADC1 at temperature of 30 °C, V _{DDA18ADC} = V _{REF+} = 1.8 V	0x4400 01B8[11:0] ⁽¹⁾⁽²⁾

1. *This is BSEC_FVR110 register which is not automatically shadowed with OTP content, so a fuse read sequence must be issued to get the register updated once (clear after reading). Refer to product reference manual - BSEC section "Operations on fuses".*

2. *Must be read in 32-bit words and relevant masking and shifting must be performed to isolate the required bits.*

6.3.5

Supply current characteristics

The current consumption is a function of several parameters and factors such as the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The current consumption is measured as described in Figure 13. [Current consumption measurement scheme](#).

All the Run mode current consumption measurements given in this section are performed with a CoreMark code unless otherwise specified.

Supply current characteristics are evaluated by characterization, not tested in production unless otherwise specified.

6.3.5.1

Typical and maximum current consumption

The device is placed under the following conditions:

- All I/O pins are in analog input mode except when explicitly mentioned
- All peripherals are disabled except when explicitly mentioned
- RTC/LSE are disabled, unless otherwise specified

- BKPSRAM, RETRAM, LPSRAM1 backup supplies in low-power modes (such as LPLV-Stop, Standby and V_{BAT} modes) are disabled, unless otherwise specified
- Unless otherwise specified, the typical values are obtained for:
 - V_{DD} / V_{DDIOx} / V_{BAT} = 3.3 V
 - V_{DDCORE} = 0.82 V
 - V_{DDCPU} = 0.8 V
 - V_{DDGPU} = 0.8 V
 - V_{DDA18} / V_{DDA18AON} = 1.8 V
and the maximum values are obtained for:
 - V_{DD} / V_{DDIOx} / V_{BAT} = 3.6 V
 - V_{DDCORE} = 0.842 V
 - V_{DDCPU} = 0.842 V
 - V_{DDGPU} = 0.839 V
 - V_{DDA18} / V_{DDA18AON} = 1.89 V

The parameters given in [Table 22](#) to [Table 34](#) are derived from tests performed under supply voltage conditions summarized in [Table 17](#). [General operating conditions](#) .

Table 22. Current consumption (I_{DDCORE}) in Run modes

Evaluated by characterization, not tested in production unless otherwise specified.

Except otherwise noted, typical values given with V_{DDCORE} = 0.82 V, V_{DDCPU} = 0.8 V and V_{DDGPU} = 0.8 V, maximum values given with V_{DDCORE} = 0.842 V, V_{DDCPU} = 0.842 V and V_{DDGPU} = 0.839 V.

1. P0 and P1 are state of cores inside CPU1 when in CRun state. 'P0&P1' indicate that both cores are executing a test software. 'P0' indicates that only P0 is executing a test software while the other core is clock gated (either in WFI or WFE or not present in the device).
2. ck_icn_ddr.
3. Values for STM32MP257x.
4. Activity on peripherals and bus masters other than processors, could lead to additional power consumption above these values, largely dependent on the amount of initialized peripherals and their activity.
5. Typical value given with V_{DDCPU} = 0.91 V, maximum values given with V_{DDCPU} = 0.935 V.
6. Typical value given with V_{DDGPU} = 0.9 V, maximum values given with V_{DDGPU} = 0.961 V.
7. Values for STM32MP255x.
8. Values for STM32MP253x.
9. Values for STM32MP251x.
10. Values for STM32MP257x and STM32MP255x.
11. Not relevant for STM32MP251x.
12. CStandby = CStop and PDDS_D1 = 1.
13. V_{DDCPU} is shutdown.
14. eCSleep mean CPU1 in enhanced CSleep with PLL1 automatically stopped (RCC_C1SREQSETR.ESLPREQ=1).

Table 23. Current consumption (I_{DDCPU}) in Run modes

Evaluated by characterization, not tested in production unless otherwise specified.

Except otherwise noted, typical values given with V_{DDCORE} = 0.82 V, V_{DDCPU} = 0.8 V and V_{DDGPU} = 0.8 V, maximum values given with V_{DDCORE} = 0.842 V, V_{DDCPU} = 0.842 V and V_{DDGPU} = 0.839 V.

1. P0 and P1 are state of cores inside CPU1 when in CRun state. 'P0&P1' indicate that both cores are executing a test software. 'P0' indicates that only P0 is executing a test software while the other core is clock gated (either in WFI or WFE or not present in the device).
2. ck_icn_ddr.
3. Values for STM32MP257x.
4. Activity on peripherals and bus masters other than processors, could lead to additional power consumption above these values, largely dependent on the amount of initialized peripherals and their activity.
5. Typical value given with V_{DDCPU} = 0.91 V, maximum values given with V_{DDCPU} = 0.935 V.
6. Typical value given with V_{DDGPU} = 0.9 V, maximum values given with V_{DDGPU} = 0.961 V.
7. Values for STM32MP255x.
8. Values for STM32MP253x.
9. Values for STM32MP251x.
10. Not relevant for STM32MP251x.
11. eCSleep mean CPU1 in enhanced CSleep (RCC_C1SREQSETR.ESLPREQ = 1).

Table 24. Current consumption (I_{DDGPU}) in Run modes

Evaluated by characterization, not tested in production unless otherwise specified.

Except otherwise noted, typical values given with $V_{DDCORE} = 0.82$ V, $V_{DDCPU} = 0.8$ V and $V_{DDGPU} = 0.8$ V, maximum values given with $V_{DDCORE} = 0.842$ V, $V_{DDCPU} = 0.842$ V and $V_{DDGPU} = 0.839$ V.

Not relevant for STM32MP251x and STM32MP253x.

Value are without GPU activity.

1. LSE is set to medium-high drive.

6.3.5.2 I/O system current consumption

The current consumption of the I/O system has two components: static and dynamic.

6.3.5.3 I/O static current consumption

All the I/Os used as inputs with pull-up generate a current consumption when the pin is externally held low. The value of this current consumption can be simply computed by using the pull-up/pull-down resistors values given in [Table 61. I/O static characteristics](#).

For the output pins, any external pull-down or external load must also be considered to estimate the current consumption.

An additional I/O current consumption is due to I/Os configured as inputs if an intermediate voltage level is externally applied. This current consumption is caused by the input Schmitt trigger circuits used to discriminate the input value. Unless this specific configuration is required by the application, this supply current consumption can be avoided by configuring these I/Os in analog mode. This is notably the case of ADC input pins which must be configured as analog inputs.

Caution: *Any floating input pin can also settle to an intermediate voltage level or switch inadvertently, as a result of external electromagnetic noise. To avoid a current consumption related to floating pins, they must either be configured in analog mode, or forced internally to a definite digital value. This can be done either by using pull-up/down resistors or by configuring the pins in output mode.*

6.3.5.4 I/O dynamic current consumption

The I/Os used by an application contribute to the current consumption. When an I/O pin switches, it uses the current from the MCU supply voltage to supply the I/O pin circuitry and to charge/discharge the capacitive load (internal or external) connected to the pin.

The theoretical formula is provided below:

$$I_{SW} = V_{DD} \times f_{SW} \times C_L$$

where

- I_{SW} is the current sunk by a switching I/O to charge/discharge the capacitive load
- V_{DDx} is the MCU supply voltage
- f_{SW} is the I/O switching frequency
- C_L is the total capacitance seen by the I/O pin: $C = C_{INT} + C_{EXT}$

6.3.6 Wake-up time from low-power modes

The wake-up times given in [Table 35](#), [Table 36](#) and [Section 6.3.6](#) are measured starting from the wake-up event trigger up to the first instruction executed by the CPU1, CPU2 or CPU3:

- the CPU1, CPU2 or CPU3 goes in low-power mode after WFI (wait for interrupt) instruction.
- For CSleep modes:
 - Interrupt to GIC or NVIC is used to wake-up from low-power modes.
- For CStop modes (except Standby and V_{BAT}):
 - For CPU1 and CPU2: EXTI1[x] is used to wake up from low-power modes.
 - For CPU3: EXTI2[x] is used to wake up from low-power modes.
- For Standby modes:
 - WKUPx is used to wake up from low-power modes.
- For V_{BAT} modes
 - TAMP_INx is used to wake up from low-power modes.
- System mode is equal to D2 domain mode

All timings are derived from tests performed under ambient temperature and $V_{DD} = 3.3$ V.

General conditions unless otherwise noted:

- CPU1 software in SYSRAM
- CPU2 software in SRAMx
- CPU3 software in LPSRAMx
- HSE is 40 MHz

- When HSI is used, HSIKERON = 0
- PWRLP_DLY = 0
- LPLVDLY_D2 = 187 μ s
- $t_{WUCSleep}$ values are measured with internal interrupt
- $t_{WUCStop}$ and $t_{WULPLV-Stop}$ values are measured with EXTI pin
- $t_{WUStandby}$ values are measured with WKUP pin through PWR
- When V_{DDCORE} or V_{DDCPU} is shutdown or reduced, the wake-up time value depends on the supply characteristics.
 - Wake-up time in the following tables is measured with a 200 μ s V_{DDCORE} and V_{DDCPU} setup time
 - V_{DDCPU} or V_{DDCORE} startup time longer than 200 μ s must be added to the wake-up time value
 - When voltage is reduced, V_{DDCORE} is assumed to be back to nominal value before LPLVDLY_D2 expiration. Otherwise, LPLVDLY_D2 value must be increased accordingly and this directly impact wake-up time value.

Table 35. D1 (CPU1) low-power mode wake-up timings

Evaluated by characterization, not tested in production. Unless otherwise noted.

Symbol	D1 (CPU1) mode	D2 (CPU2) mode	D3 (CPU3) mode	Conditions for wake-up domain	Typ	Max	Unit
$t_{WUCSleep_CPU1}$	DRun (CSleep)	Run1 (CStop)	(Reset)	SEV between CPU1 cores	-	15	CPU1 clock cycles
				HSI	-	12 + 20	$T_{ck_icn_nic} + T_{ck_cpu1_ext2f}$
				HSE + PLL1	-	12 + 20	$T_{ck_icn_nic} + T_{PLL1}$
	DRun (eCSleep) ⁽¹⁾	Run1 (CStop)	(Reset)	HSE + PLL1	-	12 + 20	$T_{ck_icn_nic} + T_{ck_cpu1_ext2f}$
$t_{WUCStop_CPU1}$	DStop1 (CStop)	Run1 (CRun)	(Reset)	HSI 64 MHz	8.2	10	μ s
				HSE + PLL1 1200 MHz	180	-	μ s
	DStop1 (CStop) ⁽²⁾	Stop1 (CStop) ⁽²⁾	(Reset)	HSI 64 MHz ⁽³⁾	3.3	15	μ s
				HSI 64 MHz	8.2	10	μ s
				HSE + PLL1 1200 MHz	180	-	μ s

1. Specified by design, not tested in production.

2. PDDS_Dx = 0.

3. HSI active (HSIKERON = 1).

4. LPDS_Dx = 1 and LVDS_Dx = 1.

5. CPU2TMPSKP = 1 or PWRLP_DLY = 0.

6. CPU2TMPSKP = 0 and PWRLP_DLY = 100 μs .

7. PDDS_Dx = 1.

8. Value in parenthesis is for wake-up using WKUP pin through PWR or wake-up using EXTI without simultaneous CPU1 wake-up.

9. PDDS_Dx = 1.

10. Value in parenthesis is for RAMCFG_RETRAMCCR1.CRCBS[2:0] = 0 (only 16 Kbytes RETRAM CRC check).

Table 37. Wake-up time using USART/LPUART

Specified by design, not tested in production.

Symbol	Parameter	Conditions	Typ	Max	Unit
$t_{WUUSART}$ $t_{WULPUART}$	Wake-up time needed to calculate the maximum USART/LPUART baud rate allowing the wake-up from low-power mode	Stop1/2 HSI clock with HSIKERON = 0	-	6.4	μs
$t_{WULPUART_LPLV}$	Wake-up time needed to calculate the maximum LPUART baud rate allowing the wake-up from low-power mode	LPLV-Stop1/2 MSI clock with MSIKERON = 0	-	580	μs

6.3.7 External clock source characteristics

6.3.7.1 High-speed external user clock generated from an external source

In bypass mode the HSE oscillator is switched off and the input pin is a standard I/O.

Digital and analog bypass modes are available.

The external clock signal must respect the [Table 61. I/O static characteristics](#). However, the recommended clock input waveform is shown in [Figure 14](#) for digital bypass mode and in [Figure 15](#) for analog bypass mode. In analog bypass mode the clock can be a sinusoidal waveform.

Table 38. High-speed external (HSE) user clock characteristics (digital bypass)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	-	-	16	40	48	MHz
V_{HSEH}	OSC_IN input pin high level voltage	-	-	$0.7 \times V_{DDA18AON}$	-	$V_{DDA18AON}$	V
V_{HSEL}	OSC_IN input pin low level voltage	-	-	V_{SS}	-	$0.3 \times V_{DDA18AON}$	
$t_{W(HSE)}$	OSC_IN high or low time	-	-	7	-	-	ns

Figure 14. High-speed external clock source AC timing diagram (digital bypass)

DT17528V1

Table 39. High-speed external (HSE) user clock characteristics (analog bypass)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{HSE_ext}	User external clock source frequency	-	16	40	48	MHz
	Input duty cycle (square wave)	-	45	50	55	%
	duty cycle deterioration ⁽¹⁾	-	-	$\pm 10^{(2)}$	$\pm 30^{(3)}$	%
V_{HSE}	Absolute input range	-	0	-	$V_{DDA18AON}$	V
V_{PP}	OSC_IN peak-to-peak amplitude	-	$0.2^{(4)}$	-	$0.67 \times V_{DDA18AON}$	
$t_{SU(HSE)}$	Time to start ⁽⁵⁾	-	-	1	$10^{(6)}$	μs
$t_r/t_f(HSE)$	Rise and Fall time (10% to 90% threshold levels of the input peak-to-peak amplitude)	-	$0.05 \times T_{HSE}$	-	$0.3 \times T_{HSE}$	ns

1. Specified by design, not tested in production.

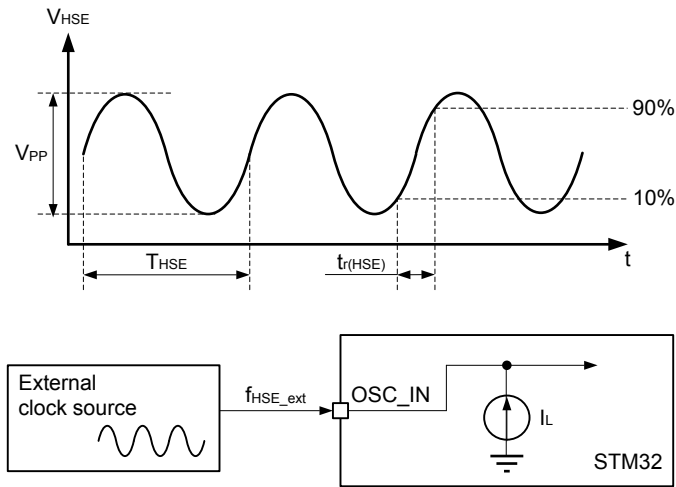

2. With a square wave signal (at 25 °C, $V_{DDA18AON} = 1.8 V$ / $V_{PP} = 400 mV$ / $V_{DC} = 0.8 V$) where V_{DC} is the DC component of the input signal.

3. With a square wave signal (at 25 °C, $V_{DDA18AON} = 1.71 V$ / $V_{PP} = 200 mV$ / $V_{DC} = 0.8 V$) where V_{DC} is the DC component of the input signal.

4. Minimum peak-to-peak amplitude (at 25 °C, $0.1 < V_{DC} < V_{DDA18AON} - 0.1 V$) where V_{DC} is the DC component of the input signal.

5. Startup time measured from the moment it is enabled (by software) to a stabilized analog bypass clock interface is reached.

6. Maximum start-up time is obtained with 200 mV peak-to-peak amplitude.

Figure 15. High-speed external clock source AC timing diagram (analog bypass)

DT47498V1

6.3.7.2 Low-speed external user clock generated from an external source

In bypass mode the LSE oscillator is switched off and the input pin is a standard I/O. The external clock signal must respect the [Table 61. I/O static characteristics](#). However, the recommended clock input waveform is shown in [Figure 16](#) for digital bypass and [Figure 17](#) for analog bypass.

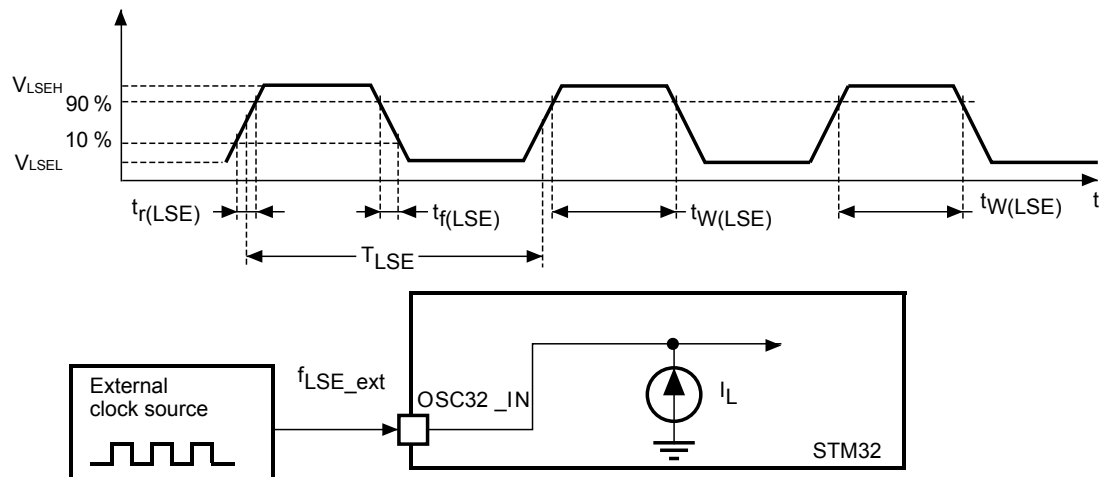

Table 40. Low-speed external (LSE) user clock characteristics (digital bypass)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE_ext}^{(1)}$	User external clock source frequency	-	-	32.768	-	kHz
V_{LSEH}	OSC32_IN input pin high level voltage	-	$0.75 \times V_{SW}$	-	$V_{SW}^{(2)}$	V
V_{LSEL}	OSC32_IN input pin low level voltage	-	V_{SS}	-	$0.25 \times V_{SW}$	
$t_{W(LSE)}$	OSC32_IN high or low time	-	250	-	-	ns

1. Specified by design, not tested in production.

2. V_{SW} is equal to V_{DD} when present or V_{BAT} otherwise.

Figure 16. Low-speed external clock source AC timing diagram (digital bypass)

DT17529V1

Table 41. Low-speed external (LSE) user clock characteristics (analog bypass)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit

V_{LSE}	Absolute input range	-	0	-	$V_{SW}^{(2)}$	V
V_{PP}	OSC32_IN peak-to-peak amplitude	-	0.2 ⁽³⁾	1	-	

1. Specified by design, not tested in production.

2. V_{SW} is equal to V_{DD} when present or V_{BAT} otherwise.

3. Minimum peak-to-peak amplitude (at 25 °C, $0.1 < V_{DC} < V_{SW} - 0.1$ V) where V_{DC} is the DC component of the input signal.

Figure 17. Low-speed external clock source AC timing diagram (analog bypass)

DT63037V1

6.3.7.3

High-speed external clock generated from a crystal/ceramic resonator

The high-speed external (HSE) clock can be supplied with a 16 to 48 MHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in Table 42. In the application, the resonator and the load capacitors must be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

Table 42. High-speed external (HSE) oscillator characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSE}^{(1)}$	Crystal frequency	-	16	40	48	MHz
$R_F^{(1)}$	Internal feedback equivalent resistor	-	-	250	-	kΩ
$I_{VDDA18AON(HSE)}$	HSE current consumption on $V_{DDA18AON}$	During startup	-	-	10	mA
		$R_m = 80 \Omega$, $C_L = 6$ pF at 40 MHz ⁽³⁾	-	4.6	-	
$G_{m_critmax}^{(1)}$	Maximum critical crystal gm	Startup	-	-	1.95	mA/V
t_{SU}	Start-up time ⁽⁴⁾	-	-	2	-	ms

1. Specified by design, not tested in production.

2. This consumption level occurs during the first 2/3 of the $t_{SU(HSE)}$ startup time.

3. Resonator characteristics given by the crystal/ceramic resonator manufacturer.

4. Measured from the moment it is enabled (by software) to a stabilized 40 MHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

For C_{L1} and C_{L2} , it is recommended to use high-quality external ceramic capacitors, designed for high-frequency applications, and selected to match the requirements of the crystal or resonator (see Figure 18). C_{L1} and C_{L2} are usually the same size. The crystal manufacturer typically specifies a load capacitance which is the series combination of C_{L1} and C_{L2} . The PCB and pin capacitance must be included (4 pF can be used as a rough estimate of the combined pin and board capacitance) when sizing C_{L1} and C_{L2} .

Note: For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs" available from the ST website www.st.com.

Figure 18. Typical application with a 40 MHz crystal

DT63062V1

6.3.7.4

Low-speed external clock generated from a crystal/ceramic resonator

The low-speed external (LSE) clock can be supplied with a 32.768 kHz crystal/ceramic resonator oscillator. All the information given in this paragraph are based on characterization results obtained with typical external components specified in Table 43. In the application, the resonator and the load capacitors must be placed as close as possible to the oscillator pins in order to minimize output distortion and startup stabilization time. Refer to the crystal resonator manufacturer for more details on the resonator characteristics (frequency, package, accuracy).

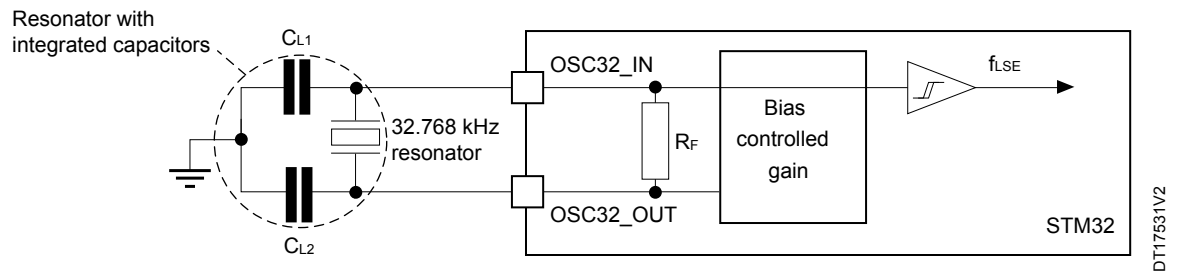

Table 43. Low-speed external (LSE) oscillator characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{LSE}^{(1)}$	Oscillator frequency	-	-	32.768	-	kHz
$G_{m_{critmax}}$	Maximum critical crystal gm	LSEDRV[1:0] = 00, Low drive capability	-	-	0.5	$\mu A/V$
		LSEDRV[1:0] = 10, Medium Low drive capability	-	-	0.75	
		LSEDRV[1:0] = 01, Medium high drive capability	-	-	1.7	
		LSEDRV[1:0] = 11, High drive capability	-	-	2.7	
$t_{SU}^{(2)}$	Startup time	V_{SW} is stabilized	-	2	-	s

1. Specified by design, not tested in production.
2. t_{SU} is the startup time measured from the moment it is enabled (by software) to a stabilized 32.768 kHz oscillation is reached. This value is measured for a standard crystal resonator and it can vary significantly with the crystal manufacturer.

Note: For information on selecting the crystal, refer to the application note AN2867 "Oscillator design guide for STM8AF/AL/S, STM32 MCUs and MPUs" available from the ST website www.st.com.

Figure 19. Typical application with a 32.768 kHz crystal

1. Adding an external resistor between OSC32_IN and OSC32_OUT is forbidden.

6.3.8 External clock source security characteristics

Table 44. High-speed external user clock security system (HSE CSS)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{DCM}(HSE_CSS)$	Time to detect clock missing	$f_{HSE} = 48 \text{ MHz}$	-	1	2	μs

Table 45. Low-speed external user clock security system (LSE CSS)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{DCM}(LSE_CSS)$	Time to detect clock missing	-	-	-	300	μs
$f_{MAX}(LSE_CSS)$	Cut-off frequency	-	-	-	2	MHz

6.3.9 Internal clock source characteristics

The parameters given in Table 46 , Table 47 and Table 48 are derived from tests performed under ambient temperature and supply voltage conditions summarized in Table 17. General operating conditions .

6.3.9.1 64 MHz high-speed internal RC oscillator (HSI)

Table 46. HSI oscillator characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$f_{HSI}^{(1)}$	HSI frequency	$V_{DDA18AON} = 1.8 \text{ V}, T_J = 30 \text{ }^\circ\text{C}$	63.68	64	64.32	MHz
TRIM	HSI trimming step	-	-	0.25	0.5	%
DuCy(HSI)	Duty Cycle	-	40	-	60	%
$\Delta V_{DDA18AON}(HSI) + \Delta T_J(HSI)$	HSI oscillator frequency drift over voltage and temperature variation (after factory calibration) ⁽²⁾	$T_J = -40 \text{ to } 125 \text{ }^\circ\text{C}$	-8.5	-	+8.5	%
$t_{su}(HSI)$	HSI oscillator start-up time (Time between Enable rising and First output clock edge.)	-	-	-	3	μs
$t_{stab}(HSI)$	HSI oscillator stabilization time	At 1% of target frequency	-	-	5	μs
$I_{VDDCORE}(HSI)$	HSI supply current on V_{DDCORE}	-	-	-	10	μA
$I_{VDD18AON}(HSI)$	HSI supply current on $V_{DDA18AON}$	-	-	300	400	μA

1. Guaranteed by test in production.

2. If better tolerance is needed (for example for UART kernel clock usage), the HSI could be trimmed during run time by measuring its frequency with a better reference like HSE crystal. The HSI trimming must be done regularly or whenever there is significant variation on supply voltage or temperature.

6.3.9.2 4/16 MHz low-power internal RC oscillator (MSI)

Table 47. MSI oscillator characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{MSI}	MSI frequency	$V_{DDCORE} = 0.82\text{ V}$, $T_J = 30\text{ }^{\circ}\text{C}$	3.956	4	4.044	MHz
		MSIFREQSEL=0 ⁽¹⁾	15.824	16	16.176	
TRIM	MSI trimming step	Trimming Code is not a multiple of 32	-	0.8	1.1	%
		Trimming Code is a multiple of 32	-	-2.5	-3.8	
DuCy(MSI)	Duty Cycle	At trimmed frequency	45	-	55	%
$\Delta T_J(\text{MSI})$	MSI oscillator frequency drift over temperature	$T_J = -40\text{ }^{\circ}\text{C}$ to $70\text{ }^{\circ}\text{C}$	-5	-	+5	%
		$T_J = -40\text{ }^{\circ}\text{C}$ to $125\text{ }^{\circ}\text{C}$	-6	-	+6	
$t_{su}(\text{MSI})$	MSI oscillator start-up time	-	-	-	3.5	μs
$I_{VDDCORE}(\text{MSI})$	MSI Supply current on V_{DDCORE}	at 4 MHz	-	20	22	μA
		at 16 MHz	-	60	68	

1. Guaranteed by test in production.

6.3.9.3 32 kHz low-speed internal (LSI) RC oscillator

Table 48. LSI oscillator characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{LSI}	LSI Frequency	$T_J = 30\text{ }^{\circ}\text{C}$ ⁽¹⁾	30.5	32	33.5	kHz
		$T_J = -40\text{ }^{\circ}\text{C}$ to $125\text{ }^{\circ}\text{C}$	28.8	32	33.6	
$t_{su}(\text{LSI})$	LSI oscillator start-up time (time between enable rising and first output clock edge.)	-	-	-	180	μs
$I_{VSW}(\text{LSI})$	LSI supply current on V_{SW} ⁽²⁾	-	-	250	500	nA

1. Guaranteed by test in production.
2. V_{SW} is equal to V_{DD} when present or V_{BAT} otherwise.

6.3.10 PLL characteristics

The parameters given in Table 49 , Table 50 , Table 51 and Table 52. PLL_LVDS characteristics are derived from tests performed under temperature and supply voltage conditions summarized in Table 17. General operating conditions .

Table 49. PLL1 to PLL8 characteristics

Specified by design, not tested in production unless otherwise specified.

6.3.13 EMC characteristics

Susceptibility tests are performed on a sample basis during device characterization.

6.3.13.1 Functional EMS (electromagnetic susceptibility)

While a simple application is executed on the device (toggling 2 LEDs through I/O ports), the device is stressed by two electromagnetic events until a failure occurs. The failure is indicated by the LEDs:

- **Electrostatic discharge (ESD)** (positive and negative) is applied to all device pins until a functional disturbance occurs. This test is compliant with the IEC 61000-4-2 standard.
- **FTB**: a burst of fast transient voltage (positive and negative) is applied to V_{DD} and V_{SS} through a 100 pF capacitor, until a functional disturbance occurs. This test is compliant with the IEC 61000-4-4 standard.

A device reset allows normal operations to be resumed.

The test results are given in Table 55. They are based on the EMS levels and classes defined in application note AN1709 available from the ST website www.st.com.

Table 55. EMS characteristics

Evaluated by characterization, not tested in production.

Symbol	Parameter	Conditions	Level/Class
V _{FESD}	Voltage limits to be applied on any I/O pin to induce a functional disturbance	V _{DD} = 3.3 V, TA = +25 °C, TFBGA436 package, F _{PLL1} = 1200 or 1500 MHz, F _{ck_ign_hs_mcu} = 400 MHz, Cortex-M33/Cortex-M0+ cores not running, conforms to IEC 61000-4-2	2B
V _{FTB}	Fast transient voltage burst limits to be applied through 100 pF on VDD and VSS pins to induce a functional disturbance		5A

As a consequence, it is recommended to add a serial resistor (1 kΩ) located as close as possible to the device pins exposed to noise (connected to tracks longer than 50 mm on PCB).

6.3.13.2 **Designing hardened software to avoid noise problems**

EMC characterization and optimization are performed at component level with a typical application environment and simplified MCU software. It must be noted that good EMC performance is highly dependent on the user application and the software.

Therefore, it is recommended that the user applies EMC software optimization and prequalification tests in relation with the EMC level requested for his application.

6.3.13.3 **Software recommendations**

The software flowchart must include the management of runaway conditions such as:

- Corrupted program counter
- Unexpected reset
- Critical Data corruption (such as control registers)

See also application note AN1015.

6.3.13.4 **Electromagnetic Interference (EMI)**

The electromagnetic field emitted by the device are monitored while a simple application, executing EEMBC code, is running. This emission test is compliant with SAE IEC61967-2 standard which specifies the test board and the pin loading.

Table 56. EMI characteristics for f_{HSE} = 40 MHz and F_{PLL1} = 1200 MHz

Evaluated by characterization, not tested in production.

Symbol	Parameter	Conditions	Monitored frequency band	Value	Unit
S _{EMI}	Peak ⁽¹⁾	V _{DD} = 3.6 V, TA = 25 °C, TFBGA436 package, F _{ck_ign_hs_mcu} = 400 MHz, Cortex-M33/Cortex-M0+ cores not running, conforming to IEC61967-2	0.1 MHz to 30 MHz	14	dBμV
			30 MHz to 130 MHz	9	
			130 MHz to 1 GHz	21

2. Refer to AN1709 "EMI level classification" section.

Table 57. EMI characteristics for $f_{HSE} = 40$ MHz and $F_{PLL1} = 1500$ MHz

Evaluated by characterization, not tested in production.

Symbol	Parameter	Conditions	Monitored frequency band	Value	Unit
S _{EMI}	Peak ⁽¹⁾	V _{DD} = 3.6 V, T _A = 25 °C, TFBGA436 package, F _{ck_ion_hs_mcu} = 400 MHz, Cortex-M33/Cortex-M0+ cores not running, conforming to IEC61967-2	0.1 MHz to 30 MHz	-	dBμV
			30 MHz to 130 MHz	-	
			130 MHz to 1 GHz	-	
			1 GHz to 2 GHz	-	
	Level ⁽²⁾		0.1 MHz to 2 GHz	-	-

1. Refer to AN1709 "EMI radiated test" section.

2. Refer to AN1709 "EMI level classification" section.

6.3.14 Absolute maximum ratings (electrical sensitivity)

Based on three different tests (ESD, LU) using specific measurement methods, the device is stressed in order to determine its performance in terms of electrical sensitivity.

6.3.14.1 Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse) are applied to the pins of each sample according to each pin combination. This test conforms to the ANSI/ESDA/JEDEC JS-001 and ANSI/ESDA/JEDEC JS-002 standards.

Table 58. ESD absolute maximum ratings

Evaluated by characterization, not tested in production.

Symbol	Ratings	Conditions	Packages	Class	Maximum value	Unit
V _{ESD(HBM)}	Electrostatic discharge voltage (human body model)	T _A = +25 °C conforming to ANSI/ESDA/JEDEC JS-001.	All	2	2000 ⁽¹⁾	V
V _{ESD(CDM)}	Electrostatic discharge voltage (charge device model)	T _A = +25 °C conforming to ANSI/ESDA/JEDEC JS-002	All	C1	250	V

1. 330 V for UCPD IOs.

6.3.14.2 Static latchup

Two complementary static tests are required on three parts to assess the latchup performance:

- A supply overvoltage is applied to each power supply pin
- A current injection is applied to each input, output and configurable I/O pin

These tests are compliant with JESD78 IC latchup standard.

Table 59. Electrical sensitivities

Evaluated by characterization, not tested in production.

Symbol	Parameter	Conditions	Class
LU	Static latchup class	T _A = +25 °C conforming to JESD78	II level A

6.3.15 I/O current injection characteristics

As a rule, a current injection to the I/O pins, due to external voltage below V_{SS} or above V_{DD} must be avoided during the normal product operation. However, in order to give an indication of the robustness of the device in cases when an abnormal injection accidentally happens, susceptibility tests are performed on a sample basis during the device characterization.

6.3.15.1 Functional susceptibility to I/O current injection

While a simple application is executed on the device, the device is stressed by injecting current into the I/O pins programmed in floating input mode. While current is injected into the I/O pin, one at a time, the device is checked for functional failures.

The failure is indicated by an out-of-range parameter:

- ADC error above a certain limit: higher than 5 LSB total unadjusted error (TUE),
- Out of conventional limits of induced leakage current on adjacent pins (out of $-5\ \mu\text{A}/+0\ \mu\text{A}$ range)
- Other functional failure (for example reset, oscillator frequency deviation).

The following tables are the compilation of the SIC1/SIC2 and functional ESD results.

Negative induced A negative induced leakage current is caused by negative injection and positive induced leakage current by positive injection.

Table 60. I/O current injection susceptibility

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Description	Negative Injection	Positive Injection	Unit
IINJ	ANA0, ANA1	5	0	mA

$I_{VDDA18AON}$	Static current consumption on $V_{DDA18AON}$		-	2	80	nA
$I_{VDDCORE}$	Static current consumption on V_{DDCORE}		-	1	180	nA
R_{PU}	Weak pull-up equivalent resistor ⁽³⁾	$2.7 < V_{DDx} < 3.6\ \text{V}$	30	40	50	k Ω
		$1.71 < V_{DDx} < 1.89\ \text{V}$	30	40	50	k Ω

Symbol	Parameter	Condition	Min	Typ	Max	Unit
R _{PD}	Weak pull-down equivalent resistor ⁽³⁾	2.7 < V _{DDx} < 3.6 V	30	40	50	kΩ
		1.71 < V _{DDx} < 1.89 V	30	40	50	kΩ
C _{IO}	I/O pin capacitance	-	-	5	-	pF

1. *Guaranteed by testing.*
2. *Specified by design, not tested in production.*
3. *The pull-up and pull-down resistors are designed with a true resistance in series with a switchable PMOS/NMOS. This PMOS/NMOS contribution to the series resistance is minimal (~10% order).*

All I/Os are CMOS and TTL compliant (no software configuration required). Their characteristics cover more than the strict CMOS-technology or TTL parameters. The coverage of these requirements for TT I/Os is shown in Figure 20 .

Figure 20. V_{IL}/V_{IH} for TT I/Os

6.3.16.1 Output driving current

The GPIOs (general purpose input/outputs) can sink or source up to ±20 mA (depending on speed setup, supply voltage range and temperature).

In the user application, I/O drive current must be limited to respect the absolute maximum rating specified in Section 6.2 , in particular:

- The sum of the currents sourced by all the I/Os on V_{DD}, plus the maximum Run mode consumption of the MCU sourced on V_{DD}, cannot exceed the absolute maximum rating ΣI_{VDD} (see Table 15).
- The sum of the currents sunk by all the I/Os on V_{SS} plus the maximum Run mode consumption of the MCU sunk on V_{SS} cannot exceed the absolute maximum rating ΣI_{VSS} (see Table 15).
- The sum of the currents sourced by PC13, PI8, PZ0, PZ1, PZ2, PZ3, PZ4, PZ5, PZ6 must be less than 6.5 mA.

6.3.16.2 Output voltage levels

Unless otherwise specified, the parameters given in Table 62 are derived from tests performed under ambient temperature and supply voltage conditions summarized in Table 17. General operating conditions . All I/Os are CMOS and TTL compliant.

Table 62. Output voltage characteristics for all I/Os

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions ⁽¹⁾ (2) (3) (4)(5)	Min	Max	Unit
V _{OL}	Output low level voltage (3.3 V range, 2.7 < V _{DDx} < 3.6 V)	I _{IO} = 6.5 mA, Speed = 0b00	-	0.4	V
		I _{IO} = 10 mA, Speed = 0b01	-	0.4	
		I _{IO} = 13 mA, Speed = 0b10	-	0.4	
		I _{IO} = 20 mA, Speed = 0b11	-	0.4	
V _{OH}	Output high level voltage (3.3 V range, 2.7 < V _{DDx} < 3.6 V)	I _{IO} = 6.5 mA, Speed = 0b00	V _{DDx} - 0.4	-	V
		I _{IO} = 10 mA, Speed = 0b01	V _{DDx} - 0.4	-	V
		I _{IO} = 13 mA, Speed = 0b10	V _{DDx} - 0.4	-	V
		I _{IO} = 20 mA, Speed = 0b11	V _{DDx} - 0.4	-	V
V _{OL}	Output low level voltage (1.8 V range, 1.71 < V _{DDx} < 1.89 V)	I _{IO} = 5.5 mA, Speed = 0b00	-	0.4	V
		I _{IO} = 8 mA, Speed = 0b01	-	0.4	V
		I _{IO} = 11 mA, Speed = 0b10	-	0.4	V
		I _{IO} = 16 mA, Speed = 0b11	-	0.4	V

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$R_{PU}^{(1)}$	Weak pull-up equivalent resistor	-	30	40	50	kΩ
t_{GEN}	NRST minimum generated output pulse	-	17.5	-	-	μs
TFILT	NRST input filtered pulse	-	-	-	50	ns
TNFILT	NRST input not filtered pulse	-	150	-	-	ns

1. The pull-up is designed with a true resistance in series with a switchable PMOS. This PMOS contribution to the series resistance must be minimum (~10% order).

Figure 21. Recommended NRST pin protection

DT14132V1

1. The reset network protects the device against parasitic resets.
2. The user must ensure that the level on the NRST pin can go below the $V_{IL(NRST)}$ max level specified in Table 68 . Otherwise, the reset is not taken into account by the device.

6.3.18 DDR IOs characteristics

Refer to JEDEC standards for more details and characteristics

- DDR3L: JESD79-3F with addendum JESD79-3-1A
- DDR4: JESD79-4D
- LPDDR4: JESD209-4D

6.3.19 FMC characteristics

Unless otherwise specified, the parameters given in Table 69 to Table 82. NAND flash write timings for the FMC interface are derived from tests performed under the ambient temperature and V_{DD} supply voltage conditions summarized in Table 17. General operating conditions , with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$

Refer to Section 6.3.16: I/O port characteristics for more details on the input/output characteristics.

6.3.19.1 Asynchronous waveforms and timings

Figure 22 through Figure 25 represent asynchronous waveforms and Table 69 through Table 76 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- AddressSetupTime = 0x1
- AddressHoldTime = 0x1
- DataSetupTime = 0x1 (except for asynchronous NWAIT mode, DataSetupTime = 0x5)
- DataHoldTime = 0x1 ($1 \times T_{fmc_ker_ck}$ for read operations and $2 \times T_{fmc_ker_ck}$ for write operations)
- ByteLaneSetup = 0x1
- BusTurnAroundDuration = 0x0
- Capacitive load $C_L = 30$ pF

In all the timing tables, the $T_{fmc_ker_ck}$ is the fmc_ker_ck clock period.

Table 69. Asynchronous non-multiplexed SRAM/PSRAM/NOR read timings

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Min	Typ	Max	Unit
$t_{w(NE)}$	FMC_NE low time	$3T_{fmc_ker_ck} - 1$	-	$3T_{fmc_ker_ck} + 0.5$	ns

Figure 25. Asynchronous multiplexed PSRAM/NOR write waveforms

DT32756V1

6.3.19.2 Synchronous waveforms and timings

Figure 26 through Figure 29 represent synchronous waveforms and Table 77 through Table 80 provide the corresponding timings. The results shown in these tables are obtained with the following FMC configuration:

- BurstAccessMode = FMC_BurstAccessMode_Enable
- MemoryType = FMC_MemoryType_CRAM
- WriteBurst = FMC_WriteBurst_Enable
- CLKDivision = 1
- DataLatency = 1 for NOR flash; DataLatency = 0 for PSRAM

In all the timing tables, the $T_{fmc_ker_ck}$ is the fmc_ker_ck clock period, with the following FMC_CLK maximum values:

- For $3.0\text{ V} < V_{DD} < 3.6\text{ V}$, FMC_CLK = 70 MHz at 20 pF (66 MHz when using FMC_NWAIT)
- For $1.71\text{ V} < V_{DD} < 1.89\text{ V}$, FMC_CLK = 70 MHz at 20 pF (66 MHz when using FMC_NWAIT)

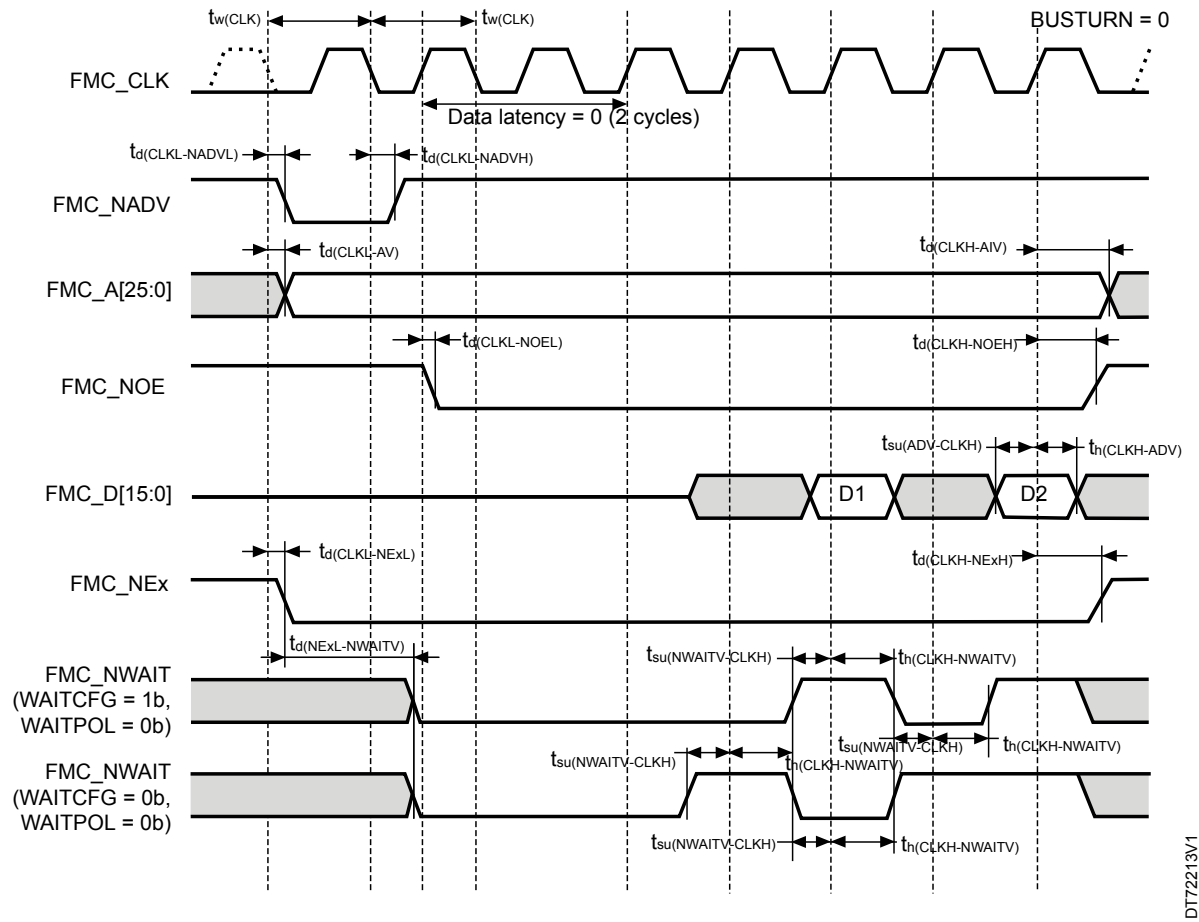

Table 77. Synchronous non-multiplexed NOR/PSRAM read timings

Evaluated by characterization, not tested in production unless otherwise specified.

6.3.19.3 NAND controller waveforms and timings

Figure 30 and Figure 31 represent synchronous waveforms, and Table 81 and Table 82 provide the corresponding timings. The results shown in this table are obtained with the following FMC configuration:

- FMC_SetupTime = 0x01
- FMC_WaitSetupTime = 0x03
- FMC_HoldSetupTime = 0x02
- FMC_HiZSetupTime = 0x01
- Bank = FMC_Bank_NAND
- MemoryDataWidth = FMC_MemoryDataWidth_16b
- ECC = FMC_ECC_Enable
- ECCPageSize = FMC_ECCPageSize_512Bytes
- TCLRSetupTime = 0
- TARSetupTime = 0
- $C_L = 30\text{-pF}$

In all timing tables, the $T_{fmc_ker_ck}$ is the fmc_ker_ck clock period.

Table 81. NAND flash read timings

DT73151V2

1. $y = 7$ or 15 depending on the NAND flash memory interface.

6.3.20

OCTOSPI interface characteristics

Unless otherwise specified, the parameters given in [Table 83](#), [Table 84](#) and [Table 85](#) for OCTOSPI are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Output speed is set to $OSPEEDRy[1:0] = 11$
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- IO compensation cell activated
- $V_{DDIOxVRSEL} = 1$ for $V_{DDIOx} < 2.7$ V

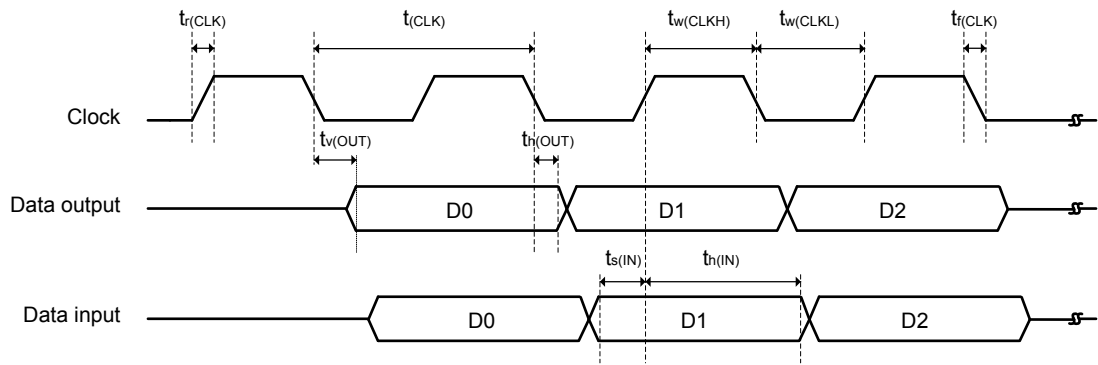

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics.

Table 83. OCTOSPI characteristics in SDR mode

Evaluated by characterization, not tested in production unless otherwise specified.

Values in the table applies to octal and quad SPI mode.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$F_{(CLK)}$	Clock frequency	$3 < V_{DDIOx} < 3.6$, $C_L = 20$ pF, OCTOSPI port1	-	-	120	MHz
		$3 < V_{DDIOx} < 3.6$, $C_L = 20$ pF, OCTOSPI port2	-	-	133	
		$2.7 < V_{DDIOx} < 3.6$, $C_L = 20$ pF, OCTOSPI port1	-	-	100	
		$2.7 < V_{DDIOx} < 3.6$, $C_L = 20$ pF, OCTOSPI port2	-	-	110	
		$1.71 < V_{DDIOx} < 1.89$, $C_L = 20$ pF	-	-	133	
$t_{w(CLKH)}$	Clock high and low time - Even division	PRESCALER[7:0] = $n = 0, 1, 3, 5$	$t_{(CLK)} / 2$	-	$t_{(CLK)}/2 + 1$	ns
$t_{w(CLKL)}$			$t_{(CLK)}/2 - 1$	-	$t_{(CLK)}/2$	
$t_{w(CLKH)}$	Clock high and low time - Odd division	PRESCALER[7:0] = $n = 2, 4, 6, 8$	$(n/2) \times t_{(CLK)} / (n+1)$	-	$(n/2) \times t_{(CLK)} / (n+1) + 1$	
$t_{w(CLKL)}$			$(n/2+1) \times t_{(CLK)} / (n+1) - 1$	-	$(n/2+1) \times t_{(CLK)} / (n+1)$	
$t_{s(IN)}$	Data input setup time	-	2.5	-	-	ns
$t_{h(IN)}$	Data input hold time	-	1.5	-	-	
$t_{v(OUT)}$	Data output valid time	-	-	0.5	1	
$t_{h(OUT)}$	Data output hold time	-	0	-	-	

Figure 32. OCTOSPI timing diagram - SDR mode

DT36878V1

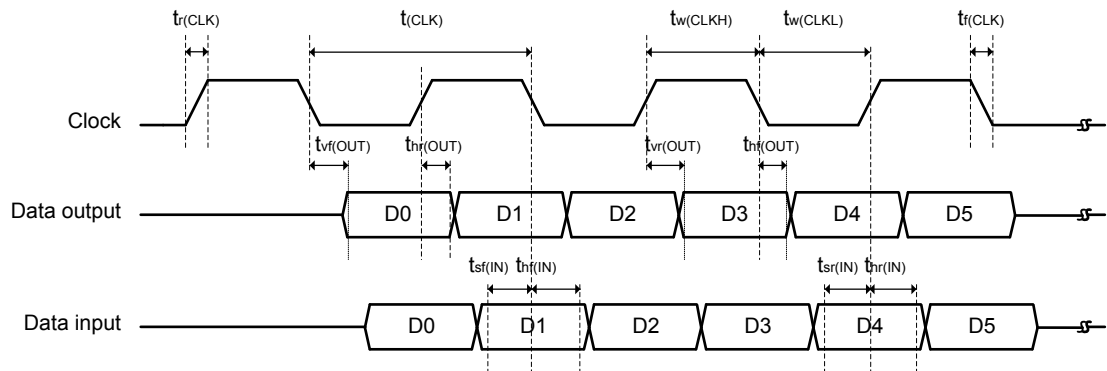

Table 84. OCTOSPI characteristics in DTR mode (without DQS)

Evaluated by characterization, not tested in production unless otherwise specified.

Values in the table applies to octal and quad SPI mode.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
F_{CLK}	Clock frequency	$2.7 < V_{\text{DDIOx}} < 3.6$, $C_L = 20 \text{ pF}$	-	-	100	MHz
		$1.71 < V_{\text{DDIOx}} < 1.89$, $C_L = 20 \text{ pF}$	-	-	100	
$t_{w(\text{CLKH})}$	Clock high and low time - Even division	PRESCALER[7:0] = n = 0,1,3,5	$t_{\text{CLK}} / 2$	-	$t_{\text{CLK}} / 2 + 1$	ns
$t_{w(\text{CLKL})}$			$t_{\text{CLK}} / 2 - 1$	-	$t_{\text{CLK}} / 2$	
$t_{w(\text{CLKH})}$	Clock high and low time - Odd division	PRESCALER[7:0] = n = 2,4,6,8	$(n/2) \times t_{\text{CLK}} / (n+1)$	-	$(n/2) \times t_{\text{CLK}} / (n+1) + 1$	
$t_{w(\text{CLKL})}$			$(n/2+1) \times t_{\text{CLK}} / (n+1) - 1$	-	$(n/2+1) \times t_{\text{CLK}} / (n+1)$	
$t_{s(\text{IN})}$, $t_{sf(\text{IN})}$	Data input setup time	-	2	-	-	
$t_{hr(\text{IN})}$, $t_{hf(\text{IN})}$	Data input hold time	-	1.5	-	-	
$t_{vr(\text{OUT})}$, $t_{vf(\text{OUT})}^{(1)}$	Data output valid time	-	-	$1 + t_{\text{CLK}} / 4$	$1.5 + t_{\text{CLK}} / 4$	
			-	1	1.5	
$t_{hr(\text{OUT})}$, $t_{hf(\text{OUT})}^{(1)}$	Data output hold time	-	$t_{\text{CLK}} / 4 - 0.5$	-	-	
			0	-	-	

1. When PRESCALER = 0 the DLL must be used for TX delay.

Figure 33. OCTOSPI timing diagram - DTR mode

DT36879v1

Table 85. OCTOSPI characteristics in DTR mode (with DQS or HyperBus)

Evaluated by characterization, not tested in production unless otherwise specified.

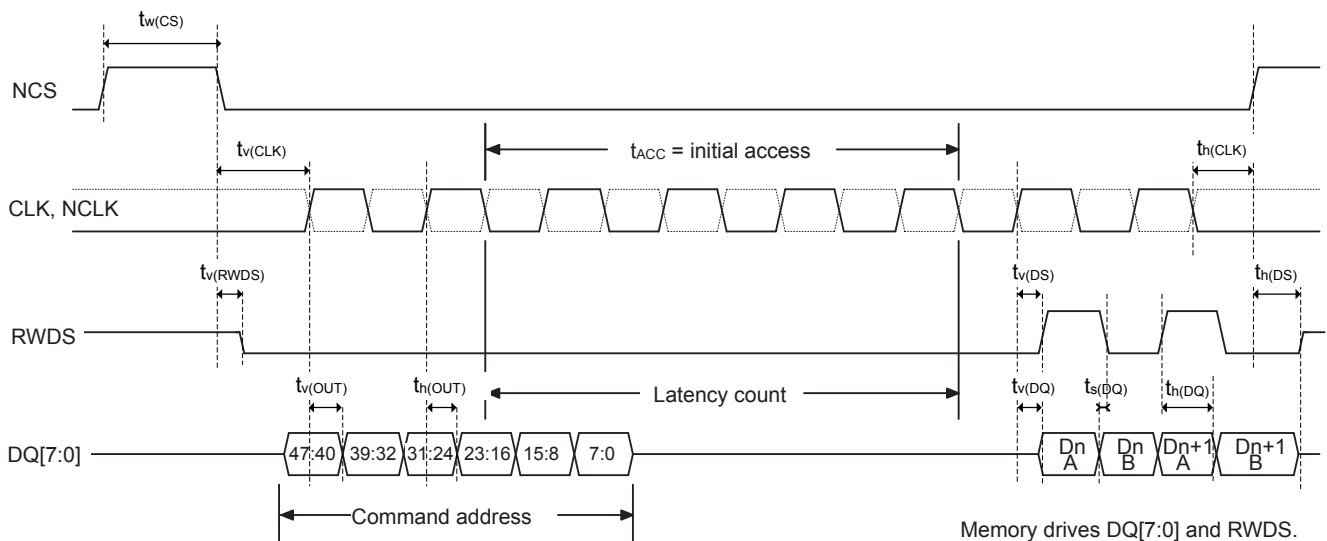

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$F_{(CLK)}$	Clock frequency	$2.7 < V_{DDIOx} < 3.6$, $C_L = 20$ pF	-	-	133	MHz
		$1.71 < V_{DDIOx} < 1.89$, $C_L = 20$ pF	-	-	133	
$t_{w(CLKH)}$	Clock high and low time - Even division	PRESCALER[7:0] = n = 0, 1, 3, 5	$t_{(CLK)} / 2$	-	$t_{(CLK)} / 2 + 1$	ns
$t_{w(CLKL)}$			$t_{(CLK)} / 2 - 1$	-	$t_{(CLK)} / 2$	
$t_{w(CLKH)}$	Clock high and low time - Odd division	PRESCALER[7:0] = n = 2, 4, 6, 8	$(n/2) \times t_{(CLK)} / (n+1)$	-	$(n/2) \times t_{(CLK)} / (n+1) + 1$	
$t_{w(CLKL)}$			$(n/2+1) \times t_{(CLK)} / (n+1) - 1$	-	$(n/2+1) \times t_{(CLK)} / (n+1)$	
$t_{w(CS)}$	Chip select high time	-	$3 \times t_{(CLK)}$	-	-

6.3.21 Delay block (DLYB) characteristics

Unless otherwise specified, the parameters given in [Table 86](#) for the delay block are derived from tests performed under the ambient temperature and V_{DD} supply voltage summarized in [Table 17](#). General operating conditions .

Table 86. DLYB characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t _{init}	Initial delay	Bypass mode	100	150	300	ps
t _Δ	Unit delay	Bypass mode	30	31	49	
		Lock mode	-	T / 32 ⁽¹⁾	-	
			-1	-	+15	%

1. T is the period of the DLL clock.

6.3.22

12-bit ADC characteristics

Unless otherwise specified, the parameters given in Table 87. ADC characteristics are derived from tests performed under the ambient temperature, frequency and V_{DDA} supply voltage conditions summarized in Table 17. General operating conditions.

Table 87. ADC characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{ADC}	ADC adc_ker_ck clock frequency (clock after ADC prescaler)	-	0.7	-	70	MHz
f_s	Sampling rate	resolution = 12 bits	0.0467	-	4.666	MSps
		resolution = 10 bits	0.0538	-	5.384	
		resolution = 8 bits	0.07	-	7	
		resolution = 6 bits	0.0875	-	8.75	
$t_{c(1)}$	Conversion cycle	resolution = 12 bits	-	13.5	-	$1 / f_{ADC}$
		resolution = 10 bits	-	11.5	-	
		resolution = 8 bits	-	8.5	-	
		resolution = 6 bits	-	6.5	-	
f_{TRIG}	External trigger frequency	$f_{ADC} = 70$ MHz, Resolution = 12 bits	-	-	3.888	MHz
			18	-	-	$1 / f_{ADC}$
$V_{AIN(1)}$	Conversion voltage range ⁽²⁾	Single ended	0	-	V_{REF+}	V
		Differential	$-V_{REF+}$	-	V_{REF+}	
$V_{CMIV(1)}$	Common mode input voltage	Differential	-	$V_{REF+} / 2$	-	V
C_{ADC}	Internal sample and hold capacitor	-	-	2.56	-	pF
t_{STAB}	ADC power-up time	DEEPPWD from 1 to 0	-	5	-	μs
t_{EN}	ADC enable time	ADEN from 0 to 1	-	5	-	$1 / f_{ADC}$
$t_{LATR(1)}$	Trigger conversion latency regular and injected channels without conversion abort	CKMODE = 0	2.5	-	3.5	$1 / f_{ADC}$
		CKMODE = 1	-	3	-	
$t_{LATRINJ(1)}$	Trigger conversion latency regular injected channels aborting a regular conversion	CKMODE = 0	3.5	-	4.5	$1 / f_{ADC}$
		CKMODE = 1	-	4	-	
$t_s(1)$	Sampling time	-	1.5	-	1499.5	$1 / f_{ADC}$
$I_{ADC(VDDA18ADC)}$	ADC supply current on $V_{DDA18ADC}$	$f_s = 4.666$ Msps, resolution = 12 bits	-	315	-	μA
		$f_s = 5.384$ Msps, resolution = 10 bits	-	330	-	
		Power down, ADEN = 0	-	2.05	-	
		Deep power down, ADEN = 0, DEEPPWD = 1	-	1.65	-	

1. Specified by design, not tested in production.

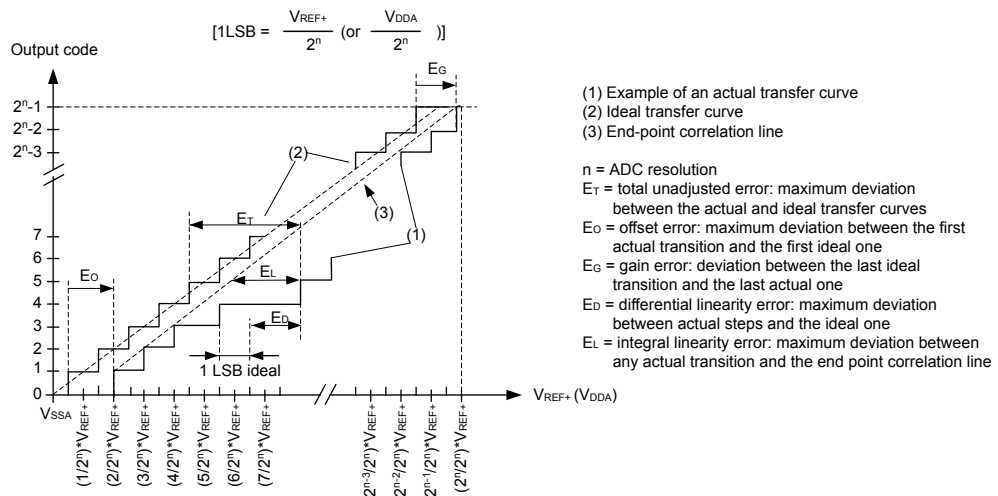

2. All analog inputs must be between V_{SSA} and $V_{DDA18ADC}$. When offset calibration is used, the result of the conversion could be clipped few percent below V_{REF+} . Refer to reference manual for details.

Table 88. ADC accuracy

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
ET	Total unadjusted error (TUE)	Single ended with dedicated ANA input	-	4.6	40	±LSB
		Differential with dedicated ANA input	-	5.2	22	
		Single ended with general purpose IO (GPIO) input	-	13	24	±LSB
		Differential with general purpose IO (GPIO) input	-	6.3	18	
ED	Differential linearity error (DNL)	Single ended with dedicated ANA input	-	0.9	2	±LSB
		Differential with dedicated ANA input	-	0.8	2	
		Single ended with general purpose IO (GPIO) input	-	0.9	2	±LSB
		Differential with general purpose IO (GPIO) input	-	0.9	2	
EL	Integral linearity error (INL)	Single ended with dedicated ANA input	-	2	6	±LSB
		Differential with dedicated ANA input	-	2	5	
		Single ended with general purpose IO (GPIO) input	-	4	6	±LSB
		Differential with general purpose IO (GPIO) input	-	3	8	
ENOB	Effective number of bits	Single ended with dedicated ANA input	-	9.9	-	Bits
		Differential with dedicated ANA input	-	10.5	-	
		Single ended with general purpose IO (GPIO) input	-	9.35	-	Bits
		Differential with general purpose IO (GPIO) input	-	10.5	-	
SINAD	Signal-to-noise and distortion ratio ⁽¹⁾	Single ended with dedicated ANA input	-	61.5	-	dB
		Differential with dedicated ANA input	-	66	-	
		Single ended with general purpose IO (GPIO) input	-	58	-	dB
		Differential with general purpose IO (GPIO) input	-	64	-	
SNR	Signal-to-noise ratio	Single ended with dedicated ANA input	-	61.5	-	dB
		Differential with dedicated ANA input	-	66.5	-	
		Single ended with general purpose IO (GPIO) input	-	58.5	-	dB
		Differential with general purpose IO (GPIO) input	-	65	-	
THD	Total harmonic distortion	Single ended with dedicated ANA input	-	-76	-	dB
		Differential with dedicated ANA input	-	-79	-	
		Single ended with general purpose IO (GPIO) input	-	-74.5	-	dB
		Differential with general purpose IO (GPIO) input	-	-73.5	-	
EG	Gain error	Versus V_{REF+} value with dedicated ANA input	-1	-	+1	%Full- Scale
		Versus V_{REF+} value with general purpose IO (GPIO) input	-1	-	+1	
EO	Offset error	Without calibration with ANA input	-1	-	+1	%Full- Scale
		After calibration with ANA input	-2	-	+2	LSB
		Without calibration with general purpose IO (GPIO) input	-1	-	+1	%Full- Scale
		After calibration with general purpose IO (GPIO) input	-2	-	+2	LSB

1. Value measured with a -0.5dBFS input signal and then extrapolated to full scale.

Figure 38. ADC accuracy characteristics

DT19880V6

1. Refer to [Table 89](#) for the values of R_{AIN} , R_{ADC} and C_{ADC} .
2. $C_{\text{parasitic}}$ represents the capacitance of the PCB (dependent on soldering and PCB layout quality) plus the pad capacitance (refer to [Table 61. I/O static characteristics](#)). A high $C_{\text{parasitic}}$ value downgrades conversion accuracy. To remedy this, f_{ADC} must be reduced.
3. Refer to [Table 61. I/O static characteristics](#) for value of I_{kg} .
4. Refer to [Figure 12. Power supply scheme](#).

Table 89. Minimum sampling time versus RAIN

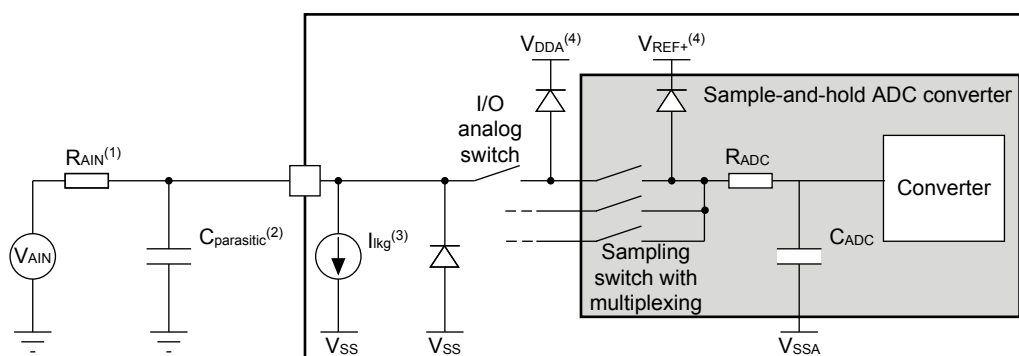

Specified by design, not tested in production.

Symbol	Parameter	Conditions (Resolution / R_{AIN} in ohms)	Min	Typ	Max	Unit
$t_{\text{s_min}}$	Minimum sampling time	12 bits	47	32	-	ns
			68	33	-	
			100	34	-	
			150	36	-

6.3.22.1 General PCB design guidelines

PCB design guidelines are provided in AN5489 "Getting started with STM32MP25xx lines hardware development" available from the ST website www.st.com.

6.3.23 Voltage reference buffer (VREFBUF) characteristics

Table 90. VREFBUF characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit
V _{DDA18ADC}	Analog supply voltage	-	VRS = 000	1.62	1.8	1.89 ⁽¹⁾	V
			VRS = 001	1.75	1.8	1.89 ⁽¹⁾	
V _{REFBUF_OUT}	Voltage Reference Buffer Output	at 30 °C, at I _{LOAD} = 10 μA, V _{DDA18ADC} = 1.8 V	VRS = 000	1.203	1.21	1.216	
			VRS = 001	1.491	1.5	1.506	
TRIM	Trim step resolution	-	-	±0.05	±0.1	%	
C _L	Load Capacitor	-	0.5	1.1	1.5	μF	
esr	Equivalent Serial Resistor of C _L	-	-	-	1	Ω	
I _{LOAD}	External DC load current	All ADCs ON	-	-	0.8	mA	
		All ADCs OFF	-	-	2		
I _{LINE_REG}	Line regulation	V _{DDA18ADC} range according to VRS value. T _J = +30 °C.		-	7500	11000	ppm/V
I _{LOAD_REG}	Load regulation	100 μA ≤ I _{LOAD} ≤ 800 μA. T _J = +30 °C.		-	4700	6000	ppm/mA
T _{coeff}	Temperature coefficient	-40 °C < T _J < +30 °C		+89	-	+305	ppm/°C
		+30 °C < T _J < +125 °C		-15	-	+68	
A _{coeff}	Long term stability	1000 hours, T _J = 125 °C		-2000	-	+2000	ppm
PSRR	Power supply rejection	DC		-	76	-	dB
		100 kHz		-	60	-	
t _{START}	Start-up time	-		-	260	388	μs
I _{INRUSH}	Control of max. DC current drive on V _{REFBUF_OUT} during start-up phase (t _{START})			-	-	10	mA
I _{VDDA18ADC(VREFBUF)}	VREFBUF supply current V _{DDA18ADC} (excluding internal and external load)	ENVR = 1	I _{LOAD} = 0.8 mA DC	-	9	21	μA
			Peak during 2 × ADC conversion	-	48	60	
		ENVR = 0	-	3	6.5	μA	

1. Static condition. 1.98 V allowed during transients.

6.3.24 Digital Temperature Sensor (DTS) characteristics

Table 91. DTS characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{DTS}	Operating frequency	-	4	-	8	MHz
Res	Resolution	-	8	10	12	Bits
Step	Step size	For respectively 8, 10 and 12 bits resolution	0.86	0.22	0.06	°C
t _{conv}	Conversion time	For respectively 8, 10 and 12 bits resolution	512	2048	8192	1 / f _{DTS}
t _{pwrup}	Power up time	-	-	-	256	

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
T _A	Accuracy	From -20 to +125 °C	-	-	3 ⁽¹⁾	°C
		From -40° C to -20 °C	-	-	6	
G	G constant	Refer to reference manual for the formula	58.5			°C
H	H constant	Refer to reference manual for the formula	201.2			°C
J	J constant	Refer to reference manual for the formula	0			°C / MHz
Cal5	Cal5 constant	Refer to reference manual for the formula	4094			-
TS _{loc}	Sensor location	TS0 sensor	Inside padding ⁽²⁾			-
		TS1 sensor	Inside device logic ⁽²⁾			-
I _{DTS(VDDA18AON)}	DTS supply current on V _{DDA18AON}	f _{DTS} = 8 MHz, continuous measurements, single sensor	-	120	160	µA
		At 1 measurement/s	-	-	1	
		f _{DTS} clock stopped	-	-	1	
I _{DTS(VDDCORE)}	DTS supply current on V _{DDCORE}	f _{DTS} = 8 MHz	-	-	15	µA

1. Guaranteed by test in production.

2. Temperature in padding sensor (side of the silicon die) is usually slightly lower than device logic sensor as most heat is generated inside device logic.

6.3.25

V_{BAT}, V_{DDCPU}, V_{DDCORE}, V_{DDGPU} ADC measurement characteristics

Table 92. V_{BAT}, V_{DDCPU}, V_{DDCORE}, V_{DDGPU} ADC measurement characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
R	Resistor bridge for V _{BAT}	-	-	130	-	kΩ
Q	Ratio on V _{BAT} measurement	-	-	4	-	-
E _r	Error on Q	-	-1	-	+1	%
t _{S_VBAT} ⁽¹⁾	ADC sampling time when reading the V _{BAT}	-	34	-	-	ns
t _{S_VDDCPU} ⁽¹⁾	ADC sampling time when reading the V _{DDCPU}	-	34	-	-	ns
t _{S_VDDCORE} ⁽¹⁾	ADC sampling time when reading the V _{DDCORE}	-	34	-	-	ns
t _{S_VDDGPU} ⁽¹⁾	ADC sampling time when reading the V _{DDGPU}	-	34	-	-	ns

1. Specified by design, not tested in production.

6.3.26

Temperature and V_{BAT} monitoring characteristic for tamper detection

Table 93. TEMP and V_{BAT} Monitoring characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
TEMPH	High T _J temperature monitoring	-	110	-	125	°C
TEMPL	Low T _J temperature monitoring	-	-40	-	-30	
V08CAPH	High V _{08CAP} supply monitoring ⁽¹⁾	-	0.88	-	1	V
V08CAPL	Low V _{08CAP} supply monitoring ⁽¹⁾	-	0.6	-	0.72	-
V08CAP_filter	V _{08CAP} supply monitoring glitch filter ⁽¹⁾	-	-	-	1	µs

1. V08CAP is an internal regulator supplied by V_{SW} . V_{SW} is equal to V_{DD} when present or V_{BAT} otherwise.

6.3.27 Voltage monitoring characteristics

Table 94. Voltage monitoring characteristics (V_{DDCORE} , V_{DDCPU} , V_{DDGPU} , PVD_IN , $V_{DDA18ADC}$, $V_{DDIO1/2/3/4}$, $V_{DD33USB}$, $V_{DD33UCPD}$)

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
V_{DDCORE} monitoring

1. Guaranteed by test in production.

6.3.28 Compensation cell characteristics

Table 95. Compensation cell characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
I _{COMPCELL}	V _{DDA18AON} current consumption during code calculation	Using a 8 MHz clock (HSI / 8)	-	250	-	μA
T _{ready}	Time needed to have the first code calculation after enabling		-	96	-	μs
T _{measure}	Time needed to update the code		-	832	-	

6.3.29 Multi-function digital filter (MDF) characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Capacitive load C_L = 30 pF
- Measurement points done at CMOS levels: 0.5 × V_{DD}
- I/O compensation cell activated
- VDDxVRSEL activated when V_{DDx} ≤ 2.7 V

Table 96. MDF characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{CKI}	Input clock frequency via MDF_CK1x pin, in SLAVE SPI mode	-	-	-	25	MHz
f _{CCKI}	Input clock frequency via MDF_CCK[1:0] pin, in SLAVE SPI mode	-	-	-	25	
f _{CCKO}	Output clock frequency in MASTER SPI mode	-	-	-	25	
f _{CCKOLF}	Output clock frequency in LF_MASTER SPI mode	-	-	-	5	
f _{SYMB}	Input symbol rate in Manchester mode	-	-	-	20	
t _{HCKI} t _{LCKI}	MDF_CK1x input clock high and low time	In SLAVE SPI mode	2 × T _{mdf_proc_ck} ⁽¹⁾		-	ns

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{HCKKI} t_{LCCKI}	MDF_CCK[1:0] input clock high and low time	In SLAVE SPI mode	$2 \times T_{mdf_proc_ck}^{(1)}$	-	-	ns
t_{HCKKO} t_{LCCKO}	MDF_CCK[1:0] output clock high and low time	In MASTER SPI mode	$2 \times T_{mdf_proc_ck}^{(1)}$	-	-	
$t_{HCKKOLF}$ $t_{LCCKOLF}$	MDF_CCK[1:0] output clock high and low time	In LF_MASTER SPI mode	$T_{mdf_proc_ck}^{(1)}$	-	-	
t_{SUCKI}	Data setup time with respect to MDF_CCKIx input	In SLAVE SPI mode, measured on rising and falling edge	7.5	-	-	
t_{HDCKI}	Data hold time with respect to MDF_CCKIx input		0.5	-	-	
t_{SUCKKI}	Data setup time with respect to MDF_CCK[1:0] input	In SLAVE SPI mode: MDF_CCK[1:0] configured in input, measured on rising and falling edge	8.5	-	-	
t_{HDCKKI}	Data hold time with respect to MDF_CCK[1:0] input		0.5	-	-	
t_{SUCKKO}	Data setup time with respect to MDF_CCK[1:0] output	In MASTER SPI mode: MDF_CCK[1:0] configured in output, measured on rising and falling edge	8.5	-	-	
t_{HDCKKO}	Data hold time with respect to MDF_CCK[1:0] output		0.5	-	-	
$t_{SUCKKOLF}$	Data setup time with respect to MDF_CCK[1:0] output	In LF_MASTER SPI mode, MDF_CCK[1:0] configured in output, measured on rising and falling edge	14.5	-	-	
$t_{HDCKKOLF}$	Data hold time with respect to MDF_CCK[1:0] output		0.5	-	-	

1. $T_{mdf_proc_ck}$ is the period of the MDF processing clock.

Camera interface (DCMI) characteristics

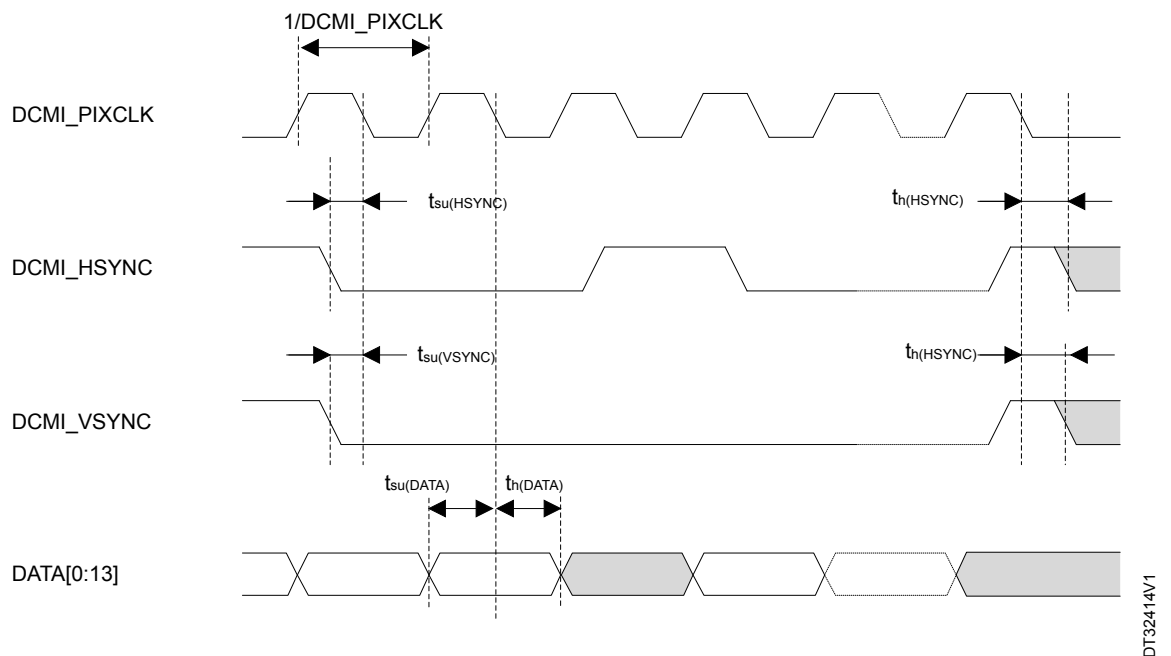

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- DCMI_PIXCLK polarity: falling
- DCMI_VSYNC and DCMI_HSYNC polarity: high
- Data formats: 14 bits
- Capacitive load $C_L = 30 \text{ pF}$
- Measurement points done at CMOS levels: $0.5 \times V_{\text{DD}}$
- I/O compensation cell activated
- VDDxVRSEL activated when $V_{\text{DDx}} \leq 2.7 \text{ V}$

Table 98. DCMI characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Min	Typ	Max	Unit
clock_ratio	Frequency ratio DCMI_PIXCLK / f_{HCLK}	-	-	0.4	-
DCMI_PIXCLK	Pixel clock input	-	-	80	MHz
DPIXEL	Pixel clock input duty cycle	30	-	70	%
$t_{su}(DATA)$	Data input setup time	3	-	-	ns
$t_h(DATA)$	Data hold time	1	-	-	
$t_{su}(HSYNC) \ t_{su}(VSYNC)$	DCMI_HSYNC and DCMI_VSYNC input setup times	3	-	-	
$t_h(HSYNC) \ t_h(VSYNC)$	DCMI_HSYNC and DCMI_VSYNC input hold times	1	-	-	

Figure 42. DCMI timing diagram

DT32414v1

6.3.32 Camera interface (DCMIPP) characteristics

Unless otherwise specified, the parameters given in Table 99 for DCMIPP are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in Table 17. General operating conditions, with the following configuration:

- DCMIPP_PIXCLK polarity: falling (refer to AN5489 "Getting started with STM32MP25xx lines hardware development") available from the ST website www.st.com.
- DCMIPP_VSYNC and DCMIPP_HSYNC polarity: high
- Data formats: 16 bits
- Capacitive load $C = 30 \text{ pF}$
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell activated
- VDDxVRSEL activated when $V_{DDx} \leq 2.7 \text{ V}$

Table 99. DCMIPP characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
DCMIPP_PIXCLK	Pixel clock input	-	-	-	120	MHz
DPixel	Pixel clock input duty cycle	-	30	-	70	%
$t_{su}(DATA)$	Data input setup time	-	2	-	-	ns
$t_h(DATA)$	Data input hold time	-	4	-	-	
$t_{su}(HSYNC) t_{su}(VSYNC)$	DCMIPP_HSYNC / DCMIPP_VSYNC input setup time	-	2	-	-	
$t_h(HSYNC) t_h(VSYNC)$	DCMIPP_HSYNC / DCMIPP_VSYNC input hold time	-	4	-	-

6.3.33

Parallel interface (PSSI) characteristics

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- PSSI_PDCK polarity: falling
- PSSI_RDY and PSSI_DE polarity: low
- Bus width: 16 lines
- Data width: 32 bits
- Capacitive load $C_L = 30$ pF
- Measurement points done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell activated
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

Table 100. PSSI transmit characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
clock_ratio	Frequency ratio DCMI_PDCK/ f_{HCLK}	-	-	-	0.4	-
PSSI_PDCK	PSSI clock input	-	-	-	74 ⁽¹⁾	MHz
DPixel	PSSI clock input duty cycle	-	30	-	70	%
$t_{OV}(DATA)$	Data output valid time	-	-	-	13.5	ns
$t_{OH}(DATA)$	Data output hold time	-	5.5	-	-	

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{OV(DE)}$	DE output valid time	-	-	-	10	ns
$t_{OH(DE)}$	DE output hold time		6.5	-	-	
$t_{SU(RDY)}$	RDY input setup time		0	-	-	
$t_{H(RDY)}$	RDY input hold time		5.5	-	-	

1. This maximal frequency does not consider receiver setup and hold timings.

6.3.34 LCD-TFT controller (LTDC) characteristics

Unless otherwise specified, the parameters given in [Table 102](#) for the LTDC interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

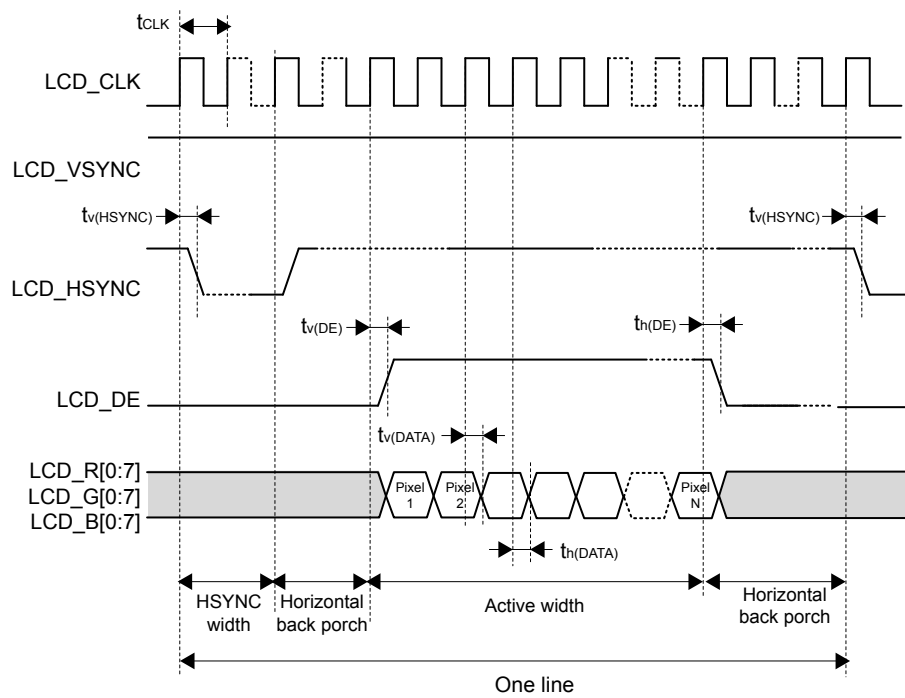

- LCD_CLK polarity: low (signals change on CLK rising edge)
- LCD_DE polarity: low
- LCD_VSYNC and LCD_HSYNC polarity: high
- Pixel formats: 24 bits
- Output speed is set to:
 - LTDC Clock: OSPEEDRy[1:0] = 11
 - Other LTDC signals: OSPEEDRy[1:0] = 01
- Advanced I/O configurations:
 - LTDC Clock: RET = 0, INVCLK = 0, DE = 0, DLYPATH = 0
 - Other LTDC signals: RET = 1, INVCLK = 0, DE = 0, DLYPATH = 0
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

Table 102. LTDC characteristics

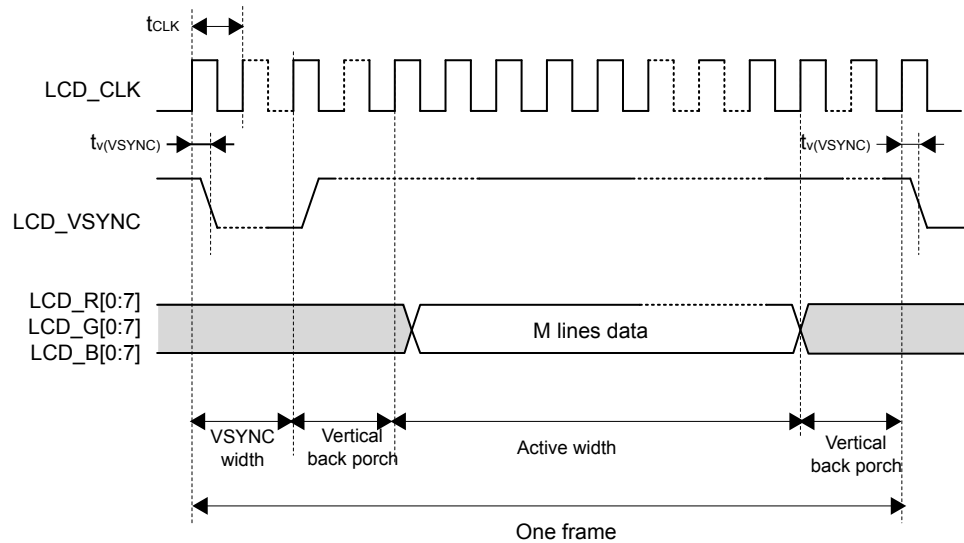

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{CLK}	LTDC clock output frequency	C = 20 pF	-	-	148.5	MHz
		C = 30 pF			120	
D_{CLK}	LTDC clock output duty cycle	-	45	-	55	%

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
$t_{w(CLKH)}, t_{w(CLKL)}$	Clock high time, low time	-	$t_{w(CLK)} / 2 - 0.5$	-	$t_{w(CLK)} / 2 + 0.5$	ns
$t_v(DATA)$	Data output valid time	-	-	-	4	
$t_h(DATA)$	Data output hold time	-	1	-	-	
$t_v(HSYNC), t_v(VSYNC), t_v(DE)$	HSYNC/VSYNC/DE output valid time	-	-	-	3.5	
$t_h(HSYNC), t_h(VSYNC), t_h(DE)$	HSYNC / VSYNC / DE output hold time	-	0.5	-	-	

Figure 46. LCD-TFT horizontal timing diagram

DT32749V1

Figure 47. LCD-TFT vertical timing diagram

DT32750V1

6.3.35 Timer characteristics

The parameters given in Table 103 are specified by design, not tested in production.

Refer to Section 6.3.16: I/O port characteristics for details on the input/output alternate function characteristics (output compare, input capture, external clock, PWM output).

Table 103. TIMx characteristics

TIMx is used as a general term to refer to the TIM1 to TIM20 timers.

Specified by design, not tested in production.

Symbol	Parameter	Min	Max	Unit
$t_{res(TIM)}$	Timer resolution time	1	-	$t_{TIMxCLK}$
$f_{TIMxCLK}$	Timer kernel clock	0	200	MHz
f_{EXT}	Timer external clock frequency on CH1 to CH4	0	$f_{TIMxCLK} / 2$	
Res_{TIM}	Timer resolution	-	16	bit
	Timer resolution (TIM2 to TIM5)	-	32	
t_{MAX_COUNT}	Maximum possible count with 16-bit counters	-	65536	$t_{TIMxCLK}$
	Maximum possible count with 32-bit counter (TIM2 to TIM5)	-	65536×65536	

Table 104. LPTIMx characteristics

LPTIMx is used as a general term to refer to the LPTIM1 to LPTIM5 timers.

Specified by design, not tested in production.

Symbol	Parameter	Min	Max	Unit
$t_{res(LPTIM)}$	Timer resolution time	1	-	$t_{LPTIMxCLK}$
$f_{LPTIMxCLK}$	Timer kernel clock	0	100	MHz
	Timer kernel clock (autonomous mode)	0	32768	Hz
f_{EXT}	Timer external clock frequency on IN1 and IN2	0	$f_{LPTIMxCLK}/2$	MHz
Res_{LPTIM}	Timer resolution	-	16	bit
t_{MAX_COUNT}	Maximum possible count	-	65536	$t_{LPTIMxCLK}$

6.3.36 Communications interfaces

6.3.36.1 I2C interface characteristics

The I2C interface meets the timings requirements of the I²C-bus specification for:

- Standard-mode (Sm): with a bit rate up to 100 kbit/s
- Fast-mode (Fm): with a bit rate up to 400 kbit/s.
- Fast-mode Plus (Fm+): with a bit rate up to 1 Mbit/s.

The I²C timings requirements are specified by design, not tested in production, when the I2C peripheral is properly configured (refer to product reference manual):

The SDA and SCL I/O requirements are met with the following restriction:

- The SDA and SCL I/O pins are not "true" open-drain. When configured as open-drain, the PMOS connected between the I/O pin and V_{DD} is disabled, but is still present.

All I2C SDA and SCL I/Os embed an analog filter. Refer to [Table 105. I2C analog filter characteristics](#) for the analog filter characteristics:

Table 105. I2C analog filter characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbols	Parameters	Min	Max	Unit
t _{AF}	Maximum pulse width of spikes that are suppressed by the analog filter	50 ⁽¹⁾	260 ⁽²⁾	ns

1. Spikes with widths below t_{AF(min)} are filtered. At T_J = -40 °C, the guaranteed minimum is 40 ns.

2. Spikes with widths above t_{AF(max)} are not filtered.

6.3.36.2 I3C interface characteristics

The I3C timings are in line with timings requirements of the MIPI® I3C specification v1.1, except for the ones given in [Table 106](#). This can be mitigated by increasing the corresponding SCL low duration in the I3C_TIMINGR0 register.

The I3C peripheral supports:

- I3C SDR-only as controller
- I3C SDR-only as target
- I3C SCL bus clock frequency up to 12.5 MHz

Unless otherwise specified, the parameters given in [Table 106](#) for the I3C interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- I/O compensation cell enabled
- VDDxVRSEL activated when V_{DDx} ≤ 2.7 V

Table 106. I3C specific timings

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t _{SU_OD}	SDA data setup time during Open-Drain mode	Controller	19.5	-	-	ns
t _{SU_PP}	SDA sata setup time in Push-Pull mode	Controller	15	-	-	ns

Table 107. I3C pin characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Min	Typ	Max	Unit
R _{PU(I3C)}	I3C pull-up	1600	2200	2800	Ω

Symbol	Parameter	Min	Typ	Max	Unit
R _{HK(I3C)}	I3C high keeper (weak pull-up)	125	160	195	kΩ

6.3.36.3 SPI interface characteristics

Unless otherwise specified, the parameters given in Table 108 for the SPI interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in Table 17. General operating conditions, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

Refer to Section 6.3.16: I/O port characteristics for more details on the input/output alternate function characteristics (NSS, SCK, MOSI, MISO for SPI).

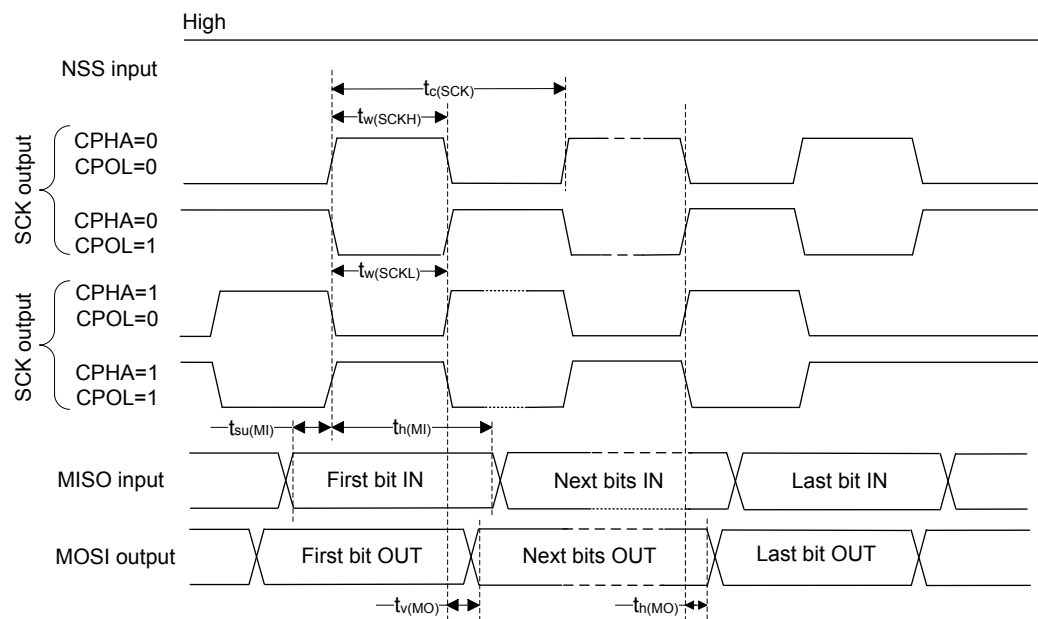

Table 108. SPI characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

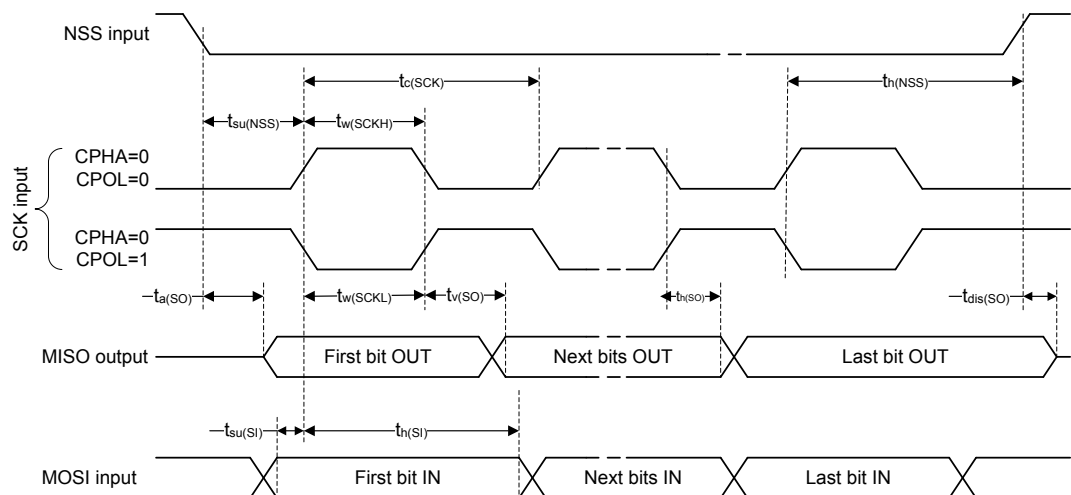

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{SCK}	SPI clock frequency	Master mode 1.71 V < V _{DD} < 1.89 V	-	-	115	MHz
		Master mode 3.0 V < V _{DD} < 3.6 V	-	-	105	
		Slave receiver mode	-	-	100	
		Slave mode transmitter/full duplex	-	-	41.5 ⁽¹⁾	
t _{su(NSS)}	NSS setup time	Slave mode	4	-	-	ns
t _{h(NSS)}	NSS hold time	Slave mode	1	-	-	
t _{w(SCKH), tw(SCKL)}	SCK high and low time	Master mode	T _{sck2} ⁽²⁾ - 1	T _{sck2} ⁽²⁾	T _{sck2} ⁽²⁾ + 1	
t _{su(MI)}	Data input setup time	Master mode	4.5	-	-	
t _{su(SI)}		Slave mode	3	-	-	
t _{h(MI)}	Data input hold time	Master mode	1	-	-	
t _{h(SI)}		Slave mode	1	-	-	
t _{a(SO)}	Data output access time	Slave mode	11	15	15	
t _{dis(SO)}	Data output disable time	Slave mode	12.5	14.5	17.5	
t _{v(MO)}	Data output valid time	Master mode	-	3	3.5	
t _{v(SO)}		Slave mode	-	11.5	12	
t _{h(MO)}	Data output hold time	Master mode	2	-	-	
t _{h(SO)}		Slave mode	10	-	-	

1. Maximum frequency in slave transmitter mode is determined by the sum of t_{v(SO)} and t_{su(MI)} which must fit into SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having t_{su(MI)} = 0 while Duty(SCK) = 50%.

2. $T_{sck2} = T_{pclk} \times \text{prescaler} / 2$.

6.3.36.4

I2S interface characteristics

Unless otherwise specified, the parameters given in [Table 109](#) for the I2S interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 01
- Capacitive load C= 30 pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

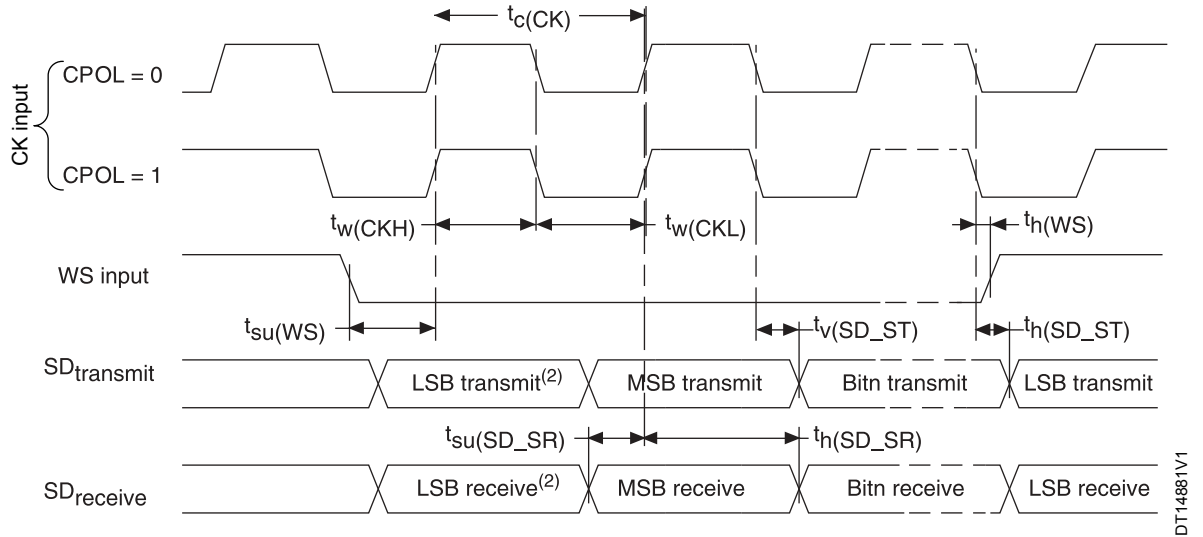

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (CK, SD, WS).

Table 109. I2S characteristics

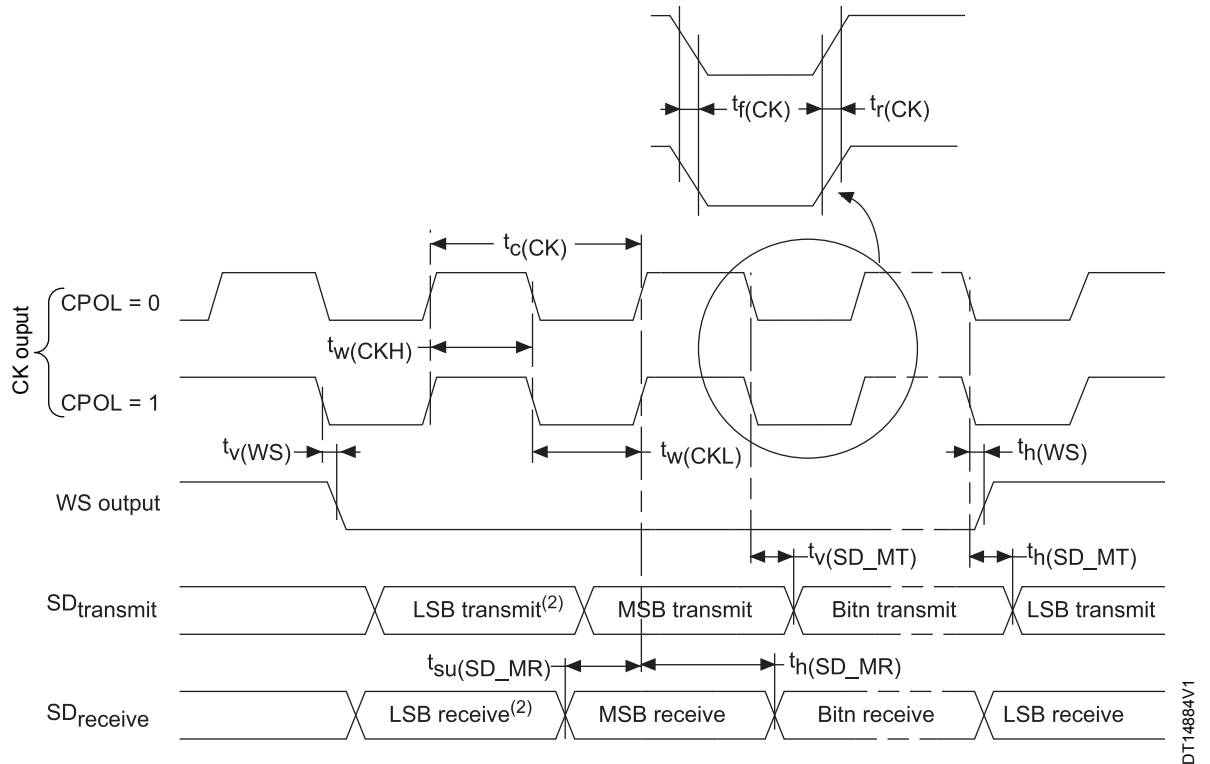

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{MCK}	I2S main clock output	-	-	-	50	MHz

6.3.36.5 SAI interface characteristics

Unless otherwise specified, the parameters given in Table 110 for SAI are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in Table 17. General operating conditions, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 10
- Capacitive load C = 30 pF
- Measurement points are performed at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

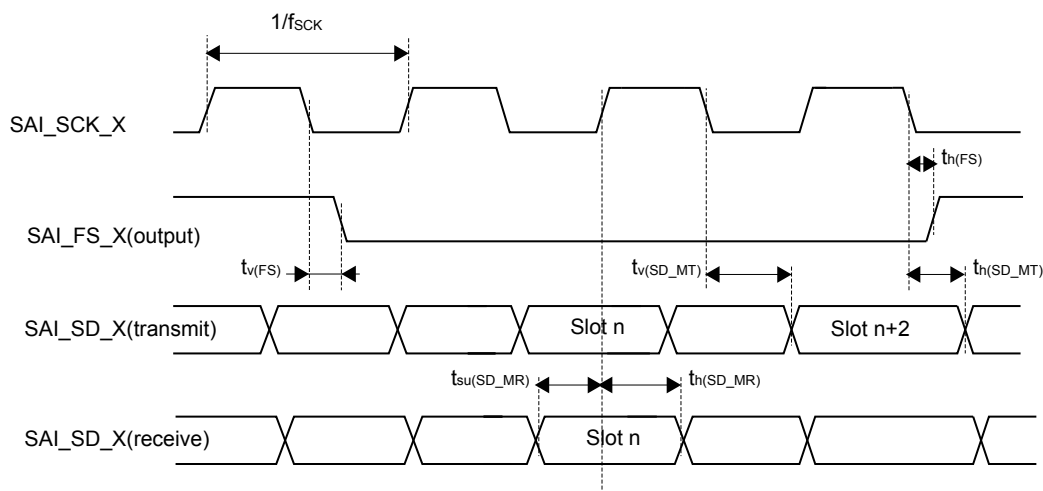

Refer to Section 6.3.16: I/O port characteristics for more details on the input/output alternate function characteristics (SCK, SD, WS).

Table 110. SAI characteristics

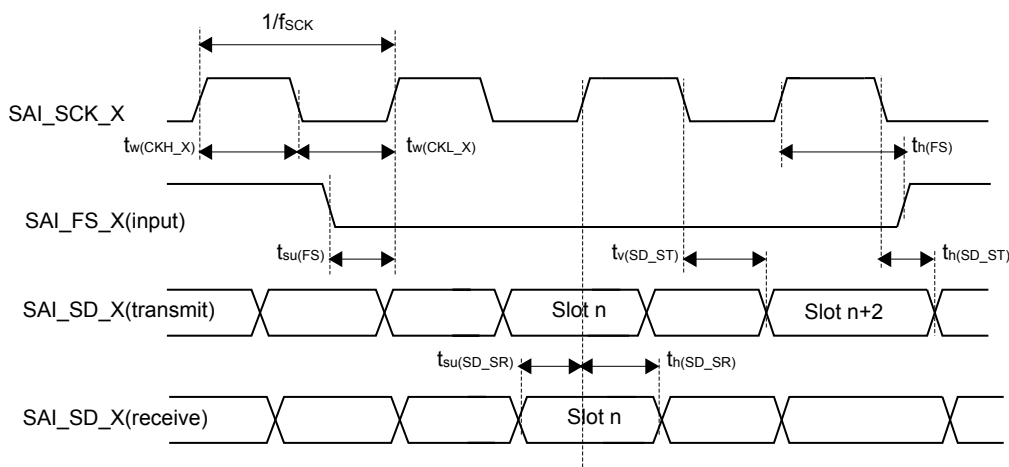

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{MCK}	SAI main clock output	-	-	-	50	MHz
f _{CK}	SAI bit clock frequency ⁽¹⁾	Master transmitter	-	-	38	MHz
		Master receiver	-	-	34	
		Slave transmitter	-	-	40	
		Slave receiver	-	-	50	
t _{v(FS)}	FS valid time	Master mode	-	-	13	ns

6.3.36.6 SD/SDIO MMC card host interface (SDMMC) characteristics

Unless otherwise specified, the parameters given in [Table 111](#) for the SDIO/MMC interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Output speed is set as table below
- Capacitive load $C = 30 \text{ pF}$
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7 \text{ V}$

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output characteristics.

Table 111. SDMMC GPIO OSPEEDR settings for timing measurements

Voltage range (V)	Max clock frequency (MHz)	OSPEEDRy[1:0]	
		Clock	Data
1.71 - 1.89 and 2.7 - 3.6	26/25	00	00

Voltage range (V)	Max clock frequency (MHz)	OSPEEDRy[1:0]	
		Clock	Data
1.71 - 1.89 and 2.7 - 3.6	52/50	01	00
	DDR 52/50	01	01
	100	01	00
2.7 - 3.6 ⁽¹⁾	120	11	10
1.71 - 1.89 ⁽¹⁾	166	11	10

1. With 20 pF load.

Table 112. SDMMC characteristics for SD-Card or SDIO usage

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{PP}	Clock frequency in data transfer mode. 20 pF load.	V _{DDIOx} = 2.7 V to 3.6 V	0	-	120	MHz
		V _{DDIOx} = 1.71 V to 1.89 V	0	-	166	
clock_ratio	SDMMC_CK / f _{pclk} frequency ratio	-	-	-	8/3	-
t _{W(CKL)}	Clock low time	f _{PP} = 52 MHz	8.5	9.5	-	ns
t _{W(CKH)}	Clock high time	f _{PP} = 52 MHz	8.5	9.5	-	
CMD, D inputs (referenced to CK) in High-Speed/SDR/DDR mode ⁽¹⁾

6.3.36.7 FDCAN (controller area network) interface

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output alternate function characteristics (FDCANx_TX and FDCANx_RX).

6.3.36.8 Ethernet (ETH) characteristics

Unless otherwise specified, the parameters given in [Table 115](#), [Table 116](#), [Table 117](#), [Table 118](#), and [Table 119](#) for ETH interface are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in [Table 17. General operating conditions](#), with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 00 (MII or RMII timings), 11 (MDIO/SMA, RGMII or RGMII-ID timings). OSPEEDRy[1:0] = 11 could be reduced to 10 if experiment give better signal integrity (for example to reduce overshoot/undershoot on light load).
- Capacitive load C = 20 pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled. For RGMII and RGMII-ID, the IO compensation is fixed to RAPSRC = 8 and RANSRC = 7.
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output characteristics.

Table 114. GPIO advance configuration settings used for RGMII and RGMII-ID characterisation

Interface	Mode	Signals	GPIOx_ADVCFGR bits				GPIOx_DELAY field
			RET	INVCLK	DE	DLYPATH	DLY[3:0]
ETH1, ETH2 ⁽¹⁾	RGMII	ETHx_RGMII_RX_CTL	1	0	1	0	0b0000
		ETHx_RGMII_RXD[3:0]					
		ETHx_RGMII_TX_CTL					
		ETHx_RGMII_TXD[3:0]					
		Other ETHx_	0	0	0	0	0b0000
	RGMII_ID (GMAC side internal delays) ⁽²⁾	ETHx_RGMII_RX_CLK	0	0	0	1	0b1101
		ETH1_RGMII_GTX_CLK	0	0	0	0	0b1100
		ETH2_RGMII_GTX_CLK	0	0	0	0	0b1011
		ETHx_RGMII_RX_CTL	1	0	1	0	0b0000
		ETHx_RGMII_RXD[3:0]					
		ETHx_RGMII_TX_CTL					
		ETHx_RGMII_TXD[3:0]					
		Other ETHx_	0	0	0	0	0b0000

1. ETH3 could use same settings as ETH1 or ETH2, except that values are specified by design and not evaluated by characterization nor tested in production.

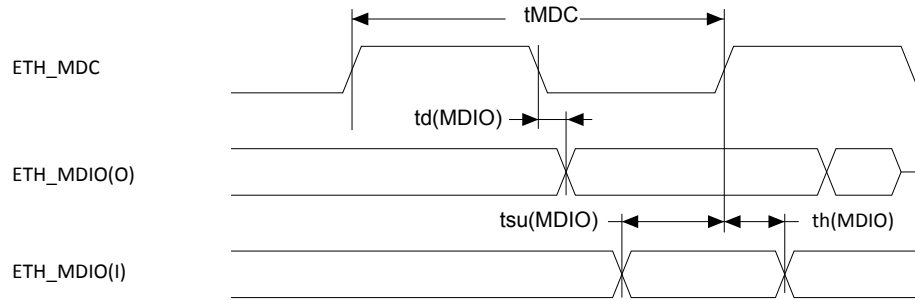

2. Use these settings only if 2ns internal delay is needed for RGMII timings. Delay values could be slightly tuned if required.

Table 115. Ethernet MAC timings for MDIO/SMA

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
t_{MDC}	MDC cycle time (2.5 MHz)	-	-	400	-	ns

6.3.36.9 USART (SPI mode) interface characteristics

Unless otherwise specified, the parameters given in Table 120 for USART are derived from tests performed under the ambient temperature, frequency and supply voltage conditions summarized in Table 120, with the following configuration:

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- VDDxVRSEL activated when $V_{DDx} \leq 2.7$ V

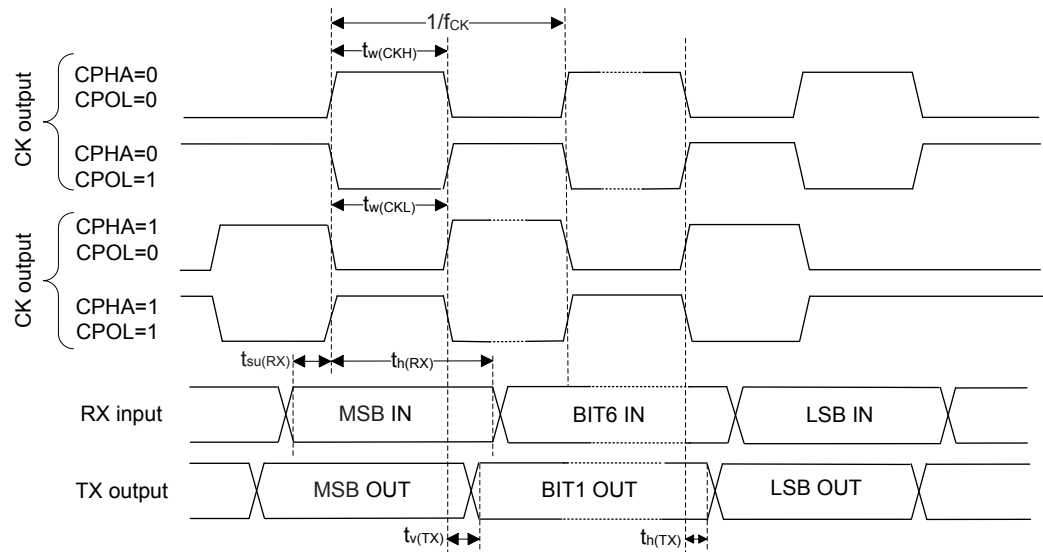

Refer to Section 6.3.16: I/O port characteristics for more details on the input/output alternate function characteristics (NSS, CK, TX, RX for USART).

Table 120. USART (SPI mode) characteristics

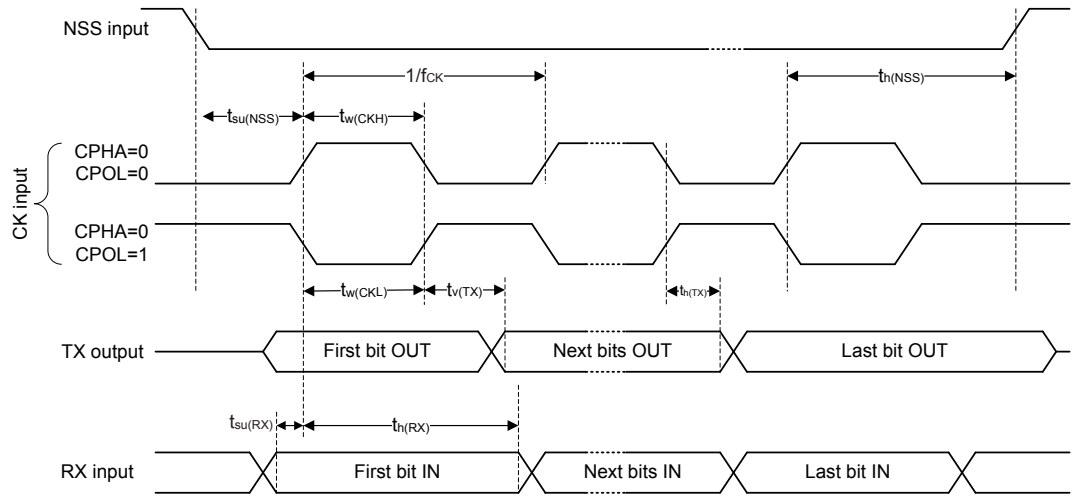

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f_{CK}	USART clock frequency	SPI master mode	-	-	16.5	MHz
		SPI slave mode	-	-	33	
		SPI slave receiver mode	-	-	44	
$t_{su(NSS)}$	NSS setup time	SPI slave mode	$t_{ker} + 4^{(1)}$	-	-	ns
$t_{h(NSS)}$	NSS hold time	SPI slave mode	1	-	-	ns
$t_{w(CKH)}, t_{w(CKL)}$	CK high and low time	SPI master mode	$1 / f_{CK} / 2 - 1$	$1 / f_{CK} / 2$	$1 / f_{CK} / 2 + 1$	ns
$t_{su(RX)}$	Data input setup time	SPI master mode	13	-	-	ns
		SPI slave mode	5	-	-	
$t_{h(RX)}$	Data input hold time	SPI master mode	0	-	-	ns
		SPI slave mode	0.5	-	-

1. Evaluated by characterization, not tested in production.

2. Packet transmission by one transceiver operating in device mode while driving all 0s data (constant JKJK on DP/DM). Loading of 10 pF. Transfers do not include any interpacket delay.

3. Packet transmission by one transceiver operating in device mode while driving all 1s data (alternating 7-bit strings of J, then K on DP/DM). Loading of 10 pF. Transfers do not include any interpacket delay.

4. HS receive mode with no traffic on the line.
5. Packet transmission by one transceiver operating in device mode while driving all 0s data (constant JKJK on DP/DM). Loading of 50 pF. Transfers do not include any interpacket delay.
6. Packet transmission by one transceiver operating in host mode while driving all 0s data (constant JKJK on DP/DM). Loading of 600 pF. Transfers do not include any interpacket delay.
7. Suspend when operating in device mode with no far-side host termination on DP/DM during measurements. Measurements taken when COMMONONN (SYSCFG_USB2PHYxCR.USB2PHYxCMN) is deasserted.
8. Sleep mode when operating in device mode with no far-side host termination on DP/DM during measurements.
9. PHY is in suspend (with clocks turned OFF), non-driving mode and operating as a portable device in the 'dead battery' condition.

6.3.37.6 COMBOPHY characteristics

Table 126. COMBOPHY characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions		Min	Typ	Max	Unit

		IMP_CTRL[4:3] = 0b11111	-	100	-	
t _r /t _f	Rise and Fall time ^{(2) (3) (4)}		0.6	-	4	V/ns
V _{CROSS}	Absolute crossing point voltage ⁽⁵⁾⁽⁶⁾⁽⁷⁾		250	400	550	mV
ΔV _{CROSS}	Variation of V _{CROSS} over all rising clock edges ⁽⁵⁾⁽⁶⁾⁽⁸⁾		-	-	140	mV
Duty_Cycle	Duty cycle ⁽²⁾		40	50	60	%
Matching	Rising edge rate to falling edge rate matching ⁽⁵⁾⁽⁹⁾		-	-	20	%

1.

2. *PCIE_CLKOUTP and PCIE_CLKOUTN are to be measured at the load capacitors CL. Single ended probes must be used for measurements requiring single ended measurements. Either single ended probes with math or differential probe can be used for differential measurements. Test load CL = 2 pF.*
3. *Measured from -150 mV to +150 mV on the differential waveform (derived from PCIE_CLKOUTP minus PCIE_CLKOUTN). The signal must be monotonic through the measurement region for rise and fall time. The 300-mV measurement window is centered on the differential zero crossing.*
4. *Measurement taken from differential waveform.*
5. *Refers to the total variation from the lowest crossing point to the highest, regardless of which edge is crossing. Refers to all crossing points for this measurement.*
6. *Measured at crossing point where the instantaneous voltage value of the rising edge of PCIE_CLKOUTP equals the falling edge of PCIE_CLKOUTN.*
7. *Measurement taken from single ended waveform.*
8. *Defined as the total variation of all crossing voltages of rising PCIE_CLKOUTP and falling PCIE_CLKOUTN. This is the maximum allowed variance in V_{CROSS} for any system.*
9. *Matching applies to rising edge rate for PCIE_CLKOUTP and falling edge rate for PCIE_CLKOUTN. It is measured using a ± 75 mV window centered on the median cross point where PCIE_CLKOUTP rising meets PCIE_CLKOUTN falling. The median cross point is used to calculate the voltage thresholds the oscilloscope is to use for the edge rate calculations. The rise edge rate of PCIE_CLKOUTP must be compared to the fall edge rate of PCIE_CLKOUTN, the maximum allowed difference must not exceed 20% of the slowest edge rate.*

6.3.37.7 UCPDPHY characteristics

Table 128. UCPDPHY characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
f _{BITRATE}	Bit rate (ensured by adequate RCC and UCPD settings)		270	300	330	Kbps
C _{RECEIVER}	Local capacitance added on PCB on each CC line		200	470	600	pF
TRANSMITTER						
V _{SWING}	Voltage swing applies on CC pin to both no load condition and under the load condition.		1.05	1.125	1.2	V
Z _{DRIVER}	TX output impedance. Source output impedance at the Nyquist frequency of USB2.0 low speed (750 kHz) while the source is driving the CC line.		33	-	75	Ω
T _r / T _f	Rise / Fall Time. 10% to 90% / 90% to 10% amplitude points, minimum is under an unloaded condition. Maximum set by TX mask.		300	-	735	ns
DCYCLE	TX duty cycle at 0.5625 V (see Y5Tx, BMC Tx 'ONE' mask and BMC Tx 'ZERO' mask in the PD Specification) ⁽¹⁾		47	-	53	%
RECEIVER						
V _{IL}	Rx receive input thresholds. The position of the center line of the inner mask is dependent on whether the receiver is sourcing or sinking power or is power neutral ⁽¹⁾	sourcing power	-	-	0.4825	V
V _{IH}			0.8925	-	-	
V _{IL}		sinking power	-	-	0.2325	V
V _{IH}			0.6425	-	-	
Hysteresis	Rx receive input hysteresis		0.15	-	-	
N _{COUNT} ⁽²⁾	Number of transitions for signal detection (number to count to detect non-idle bus).		3	-	-	-
t _{TRANWIN} ⁽²⁾	Time window for detecting non-idle bus.		12	-	20	μ s
Z _{BMC RX} ⁽³⁾	Receiver input impedance		1	-	-	M Ω

1. Refer to the "USB Power Delivery (PD) Specification" Revision 3.1, Version 1.8.
2. BMC packet collision is avoided by the detection of signal transitions at the receiver. Detection is active when a minimum of N_{COUNT} transitions occur at the receiver within a time window of t_{TRANWIN}. After waiting t_{TRANWIN} without detecting N_{COUNT} transitions, the bus is declared idle. These times are informative for UCPDPHY as it is done digitally inside UCPD Peripheral.
3. Does not include pull-up or pull-down resistance from cable detect. Transmitter is Hi-Z.

6.3.38
JTAG/SWD interface characteristics

Unless otherwise specified, the parameters given in [Table 129](#) and [Table 130](#) for JTAG/SWD are derived from tests performed under the ambient temperature, frequency and V_{DD} supply voltage summarized in [Table 17. General operating conditions](#), with the following configuration:

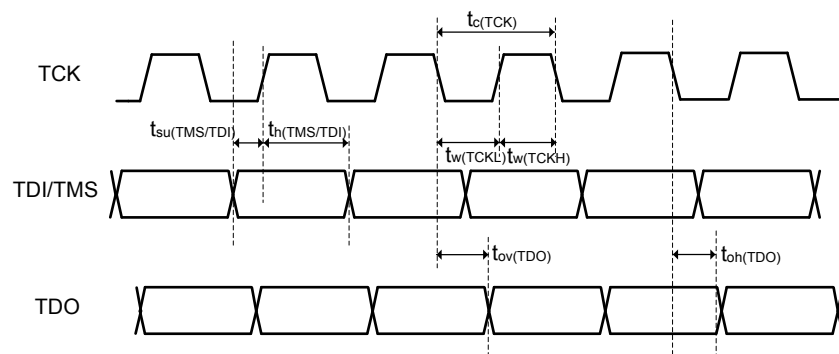

- Output speed is set to $OSPEEDRy[1:0] = 01$
- Capacitive load $C = 30$ pF
- Measurement points are done at CMOS levels: $0.5 \times V_{DD}$
- I/O compensation cell enabled
- $VDDxVRSEL$ activated when $V_{DDx} \leq 2.7$ V

Refer to [Section 6.3.16: I/O port characteristics](#) for more details on the input/output characteristics.

Table 129. JTAG dynamic characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
F_{pp}	TCK clock frequency	-	-	-	45	MHz
$1/t_c(TCK)$						
$t_{su}(TMS)$	TMS input setup time	-	2	-	-	ns
$t_{ih}(TMS)$	TMS input hold time	-	1	-	-	
$t_{su}(TDI)$	TDI input setup time	-	3	-	-	
$t_{ih}(TDI)$	TDI input hold time	-	0.5	-	-	
$t_{ov}(TDO)$	TDO output valid time	-	-	9	11	
$t_{oh}(TDO)$	TDO output hold time	-	7	-	-	

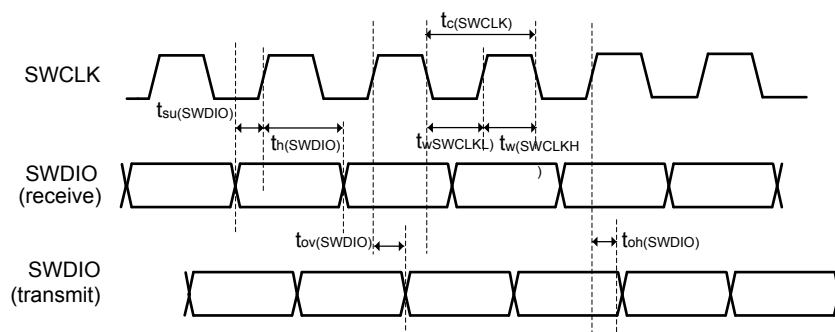

Figure 65. JTAG timing diagram

DT40458V1

Table 130. SWD dynamic characteristics

Evaluated by characterization, not tested in production unless otherwise specified.

Symbol	Parameter	Conditions	Min	Typ	Max	Unit
F_{pp}	SWCLK clock frequency	-	-	-	80	MHz
$1/t_c(SWCLK)$						
$t_{su}(SWDIO)$	SWDIO input setup time	-	1.5	-	-	ns
$t_{ih}(SWDIO)$	SWDIO input hold time	-	2.5	-	-	
$t_{ov}(SWDIO)$	SWDIO output valid time	-	-	9	12.5	
$t_{oh}(SWDIO)$	SWDIO output hold time	-	5	-	-

7 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com. ECOPACK is an ST trademark.

7.1 Device marking

Refer to technical note "Reference device marking schematics for STM32 microcontrollers and microprocessors" (TN1433) available on www.st.com, for the location of pin 1 / ball A1 as well as the location and orientation of the marking areas versus pin 1 / ball A1.

Parts marked as "ES", "E" or accompanied by an engineering sample notification letter, are not yet qualified and therefore not approved for use in production. ST is not responsible for any consequences resulting from such use.

In no event will ST be liable for the customer using any of these engineering samples in production. ST's Quality department must be contacted prior to any decision to use these engineering samples to run a qualification activity.

A WLCSP simplified marking example (if any) is provided in the corresponding package information subsection.

7.2 TFBGA361 package information (B0N8)

This TFBGA is a 361-ball, 16 x 16 mm thin fine pitch ball grid array package.

Figure 67. TFBGA361 - Outline

B0N8_TFBGA361_ME_V1

fff ⁽⁸⁾	0.08 BSC			0.0031 BSC		

1. Values in inches are converted from mm and rounded to four decimal digits.
2. The profile height, A, is the distance from the seating plane to the highest point on the package. It is measured perpendicular to the seating plane.
3. A1 is defined as the distance from the seating plane to the lowest point on the package body.
4. Dimension b is measured at the maximum diameter of the terminal (ball) in a plane parallel to primary datum C.
5. BSC stands for BASIC dimensions. It corresponds to the nominal value and has no tolerance.
6. e represents the solder ball grid pitch.
7. N represents the total number of balls on the BGA.
8. Tolerance of form and position definitions.

7.3 VFBGA361 package information (B09U)

This VFBGA is a 361-ball, 10 x 10 mm, very thin fine pitch ball grid array package.

Figure 68. VFBGA361 - Outline

Table 132. VFBGA361 - Mechanical data

eee ⁽⁹⁾	0.150			0.0059		
fff ⁽⁹⁾	0.050			0.0020		

1. Values in inches are converted from mm and rounded to 4 decimal digits.
2. The profile height, A, is the distance from the seating plane to the highest point on the package. It is measured perpendicular to the seating plane
3. A1 is defined as the distance from the seating plane to the lowest point on the package body.
4. Dimension b is measured at the maximum diameter of the terminal (ball) in a plane parallel to primary datum C.
5. BSC stands for BASIC dimensions. It corresponds to the nominal value and has no tolerance. For tolerances refer to form and position table
6. e(x) represents the solder ball grid pitch(es).
7. N represents the total number of balls on the BGA.
8. Basic dimensions SD(x) & SE(y) are defined with respect to datums A and B. They define the position of the centre ball(s) of the ball matrix.
9. Tolerance of form and position drawing.

7.4 VFBGA424 package information (B0MP)

This VFBGA is a 424-ball, 14 x 14 mm, very thin fine pitch ball grid array package.

Figure 69. VFBGA424 - Outline

1. Drawing is not to scale.
2. Primary datum C is defined by the plane established by the contact points of three or more solder balls that support the device when it is placed on top of a planar surface.

- The terminal (ball) A1 corner must be identified on the top surface of the package by using a corner chamfer, ink or metallized markings, or other feature of package body or integral heat slug. A distinguish feature is allowable on the bottom surface of the package to identify the terminal A1 corner. Exact shape of each corner is optional.

Table 133. VFBGA424 - Mechanical data

8. Basic dimensions SD(x) & SE(y) are defined with respect to datums A and B. They define the position of the centre ball(s) of the ball matrix.
9. Tolerance of form and position drawing.

7.6 Package thermal characteristics

The maximum chip-junction temperature, $T_J \text{ max}$, in degrees Celsius, can be calculated using the following equation:

$$T_J \text{ max} = T_A \text{ max} + (P_D \text{ max} \times \Theta_{JA})$$

where:

- $T_A \text{ max}$ is the maximum ambient temperature in °C.
- Θ_{JA} is the package junction-to-ambient thermal resistance in °C/W.
- $P_D \text{ max}$ is the sum of $P_{INT} \text{ max}$ and $P_{I/O} \text{ max}$:

$$P_D \text{ max} = P_{INT} \text{ max} + P_{I/O} \text{ max}$$
- $P_{INT} \text{ max}$ is the product of I_{DD} and V_{DD} , expressed in Watts. This is the maximum chip internal power.

$P_{I/O \text{ max}}$ represents the maximum power dissipation on output pins:

$$P_{I/O \text{ max}} = \sum (V_{OL} \times I_{OL}) + \sum ((V_{DDIOx} - V_{OH}) \times I_{OH})$$

considering the actual V_{OL}/I_{OL} and V_{OH}/I_{OH} of the I/Os at low and high level in the application.

Table 135. Package thermal characteristics

Symbol	Parameter	Package	Value	Unit
Θ_{JA}	Thermal resistance junction-ambient	TFBGA361 16×16 mm	20.2	°C/W
		VFBGA361 10×10 mm	23.1	
		VFBGA424 14×14 mm	20.9	
		TFBGA436 18×18 mm	19.5	
Θ_{JB}	Thermal resistance junction-board	TFBGA361 16×16 mm	11.7	
		VFBGA361 10×10 mm	9.5	
		VFBGA424 14×14 mm	11.8	
		TFBGA436 18×18 mm	11.6	
Θ_{JC}	Thermal resistance junction-top case	TFBGA361 16×16 mm	5.5	
		VFBGA361 10×10 mm	5.7	
		VFBGA424 14×14 mm	5.5	
		TFBGA436 18×18 mm	5.4

8 Ordering information

Example:

STM32 MP 257 F AI 3 _ T

Device family

STM32 = Arm® -based 32- or 64-bit processor

Product type

MP = MPU product

Device subfamily

251 = STM32MP251 line

253 = STM32MP253 line

255 = STM32MP255 line

257 = STM32MP257 line

Security option

C = Secure boot, cryptography hardware, 1.2 GHz CPU1, 800 MHz GPU⁽¹⁾

F = Secure boot, cryptography hardware, 1.5 GHz CPU1, 900 MHz GPU⁽¹⁾

Package and ball count

AJ = TFBGA361 16x16, 361 balls pitch 0.8 mm

AL = VFBGA361 10x10, 361 balls pitch 0.5 mm

AK = VFBGA424 14x14, 424 balls pitch 0.5 mm

AI = TFBGA436 18x18, 436 balls pitch 0.8 mm

Junction temperature range

3 = -40 °C < T_J < +125 °C

Options

_ (absent) = no options

Packing

T = Tape and reel

No character = tray or tube

1. GPU is absent in some devices (see [Section 2](#) for details).

Note: For a list of available options (such as speed and package) or for further information on any aspect of this device, contact your nearest ST sales office.

Important security notice

The STMicroelectronics group of companies (ST) places a high value on product security, which is why the ST product(s) identified in this documentation may be certified by various security certification bodies and/or may implement our own security measures as set forth herein. However, no level of security certification and/or built-in security measures can guarantee that ST products are resistant to all forms of attacks. As such, it is the responsibility of each of ST's customers to determine if the level of security provided in an ST product meets the customer needs both in relation to the ST product alone, as well as when combined with other components and/or software for the customer end product or application. In particular, take note that:

- ST products may have been certified by one or more security certification bodies, such as Platform Security Architecture (www.psacertified.org) and/or Security Evaluation standard for IoT Platforms (www.trustcb.com). For details concerning whether the ST product(s) referenced herein have received security certification along with the level and current status of such certification, either visit the relevant certification standards website or go to the relevant product page on www.st.com for the most up to date information. As the status and/or level of security certification for an ST product can change from time to time, customers should re-check security certification status/level as needed. If an ST product is not shown to be certified under a particular security standard, customers should not assume it is certified.
- Certification bodies have the right to evaluate, grant and revoke security certification in relation to ST products. These certification bodies are therefore independently responsible for granting or revoking security certification for an ST product, and ST does not take any responsibility for mistakes, evaluations, assessments, testing, or other activity carried out by the certification body with respect to any ST product.
- Industry-based cryptographic algorithms (such as AES, DES, or MD5) and other open standard technologies which may be used in conjunction with an ST product are based on standards which were not developed by ST. ST does not take responsibility for any flaws in such cryptographic algorithms or open technologies or for any methods which have been or may be developed to bypass, decrypt or crack such algorithms or technologies.
- While robust security testing may be done, no level of certification can absolutely guarantee protections against all attacks, including, for example, against advanced attacks which have not been tested for, against new or unidentified forms of attack, or against any form of attack when using an ST product outside of its specification or intended use, or in conjunction with other components or software which are used by customer to create their end product or application. ST is not responsible for resistance against such attacks. As such, regardless of the incorporated security features and/or any information or support that may be provided by ST, each customer is solely responsible for determining if the level of attacks tested for meets their needs, both in relation to the ST product alone and when incorporated into a customer end product or application.
- All security features of ST products (inclusive of any hardware, software, documentation, and the like), including but not limited to any enhanced security features added by ST, are provided on an "AS IS" BASIS. AS SUCH, TO THE EXTENT PERMITTED BY APPLICABLE LAW, ST DISCLAIMS ALL WARRANTIES, EXPRESS OR IMPLIED, INCLUDING BUT NOT LIMITED TO THE IMPLIED WARRANTIES OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE, unless the applicable written and signed contract terms specifically provide otherwise.

Updated Section 6.3.7.3: High-speed external clock generated from a crystal/ceramic resonator. Updated Table 46. HSI oscillator characteristics. Updated Table 58. ESD absolute maximum ratings. Updated Table 61. I/O static characteristics Updated Section 6.3.19.2: Synchronous waveforms and timings. Updated Table 77. Synchronous non-multiplexed NOR/PSRAM read timings. Updated Figure 26. Synchronous non-multiplexed NOR/PSRAM read timings. Updated Table 78. Synchronous non-multiplexed PSRAM write timings. Updated Figure 27. Synchronous non-multiplexed PSRAM write timings. Updated Table 79. Synchronous multiplexed NOR/PSRAM read timings. Updated Figure 28. Synchronous multiplexed NOR/PSRAM read timings. Updated Table 80. Synchronous multiplexed PSRAM write timings. Updated Figure 29. Synchronous multiplexed PSRAM write timings. Updated Table 90. VREFBUF characteristics. Updated Table 99. DCMIPP characteristics. Updated Table 108. SPI characteristics. Updated Table 111. SDMMC GPIO OSPEEDR settings for timing measurements. Updated Table 112. SDMMC characteristics for SD-Card or SDIO usage. Updated Table 113. SDMMC characteristics for eMMC usage.
07-Jan-2025	4	<p>Master and slave terms in Section 3.52: Inter-integrated circuit interface (I2C1/2/3/4/5/6/7/8) replaced with controller and target, respectively.</p> <ul style="list-style-type: none"> Speed updated to 12 Mbit/s in Section 3.54: Universal synchronous asynchronous receiver transmitter (USART1/2/3/6, UART4/5/7/8/9). Added bullet in Section 6.3.16.1: Output driving current. Added footnote to Table 62. Output voltage characteristics for all I/Os. Added title note to Table 63. Output timing characteristics ($V_{DD} = 3.0 - 3.6$ V or $V_{DDIOx} = 2.7 - 3.6$ V, $V_{DDIOxVRSEL} = 0$). Added title note to Table 64. Output timing characteristics ($V_{DD}/V_{DDIOx} = 1.71 - 1.89$ V, $V_{DDIOxVRSEL} = 1$).

Date	Revision	Changes
		<ul style="list-style-type: none"> Added title note to Table 65. Output timing characteristics ($V_{DD}/V_{DDIOx} = 1.71 - 1.89 \text{ V}$, $V_{DDIOxVRSEL} = 0$ degraded mode). Added Table 66. Output timing characteristics ($V_{SW} = 1.71 - 3.6 \text{ V}$). Updated footnote 2 in Table 87. ADC characteristics. Updated Section 7.5: TFBGA436 package information (B0MS) including Figure 70. TFBGA436 - Outline.
24-Apr-2025	5	<p>Master and slave terms in Section 6.3.36.4: I2S interface characteristics replaced with controller and target, respectively.</p> <ul style="list-style-type: none"> Updated Table 14. Voltage characteristics. Updated Section 6.3.36.8: Ethernet (ETH) characteristics. Added Table 114. GPIO advance configuration settings used for RGMII and RGMII-ID characterisation. Added Table 118. Ethernet MAC timings for RGMII. Added Figure 61. Ethernet RGMII timing diagram. Added Table 119. Ethernet MAC timings for RGMII_ID. Added Figure 62. Ethernet RGMII-ID timing diagram. Updated Section 7.2: TFBGA361 package information (B0N8). Updated Figure 67. TFBGA361 - Outline. Updated Table 131. TFBGA361 - Mechanical data.

Contents

1	Introduction	5
2	Description	6
3	Functional overview	13
3.1	Dual-core Arm Cortex-A35 subsystem (CA35SS)	13
3.1.1	Features	13
3.1.2	Overview	13
3.2	Arm Cortex-M33 core with TrustZone and FPU (CM33)	14
3.3	Arm Cortex-M0+ core (CM0P)	14
3.4	Graphic processing unit (GPU)	15
3.5	Neural processor unit (NPU)	15
3.6	Memories	15
3.6.1	External SDRAM	15
3.6.2	Embedded SRAM	16
3.7	DDR3L/DDR4/LPDDR4 controller (DDRCTRL)	16
3.8	Boot modes	16
3.9	Power supply management (PWR)	19
3.9.1	Power supply scheme	19
3.9.2	Power-supply supervisor	20
3.10	Low-power strategy	21
3.11	Resource isolation framework (RIF)	21
3.12	Reset and clock controller (RCC)	21
3.12.1	Features	22
3.12.2	Clock management	22
3.12.3	Reset sources	22
3.13	Hardware semaphore (HSEM)	23
3.14	Inter-processor communication controller (IPCC1/2)	23
3.14.1	Main features	23
3.15	General-purpose input/outputs (GPIO)	24
3.16	Bus-interconnect matrix	24
3.17	High-performance DMA controllers (HPDMA1/2/3)	26
3.18	Low-power DMA controller (LPDMA1)	27
3.19	Cortex-M33 nested vectored interrupt controller (NVIC)	27
3.20	Cortex-M0+ nested vectored interrupt controller (NVIC)	27
3.21	Extended interrupt and event controller (EXTI1/2)	27
3.22	Cyclic redundancy check calculation unit (CRC)	28

3.23	Flexible memory controller (FMC)	28
3.24	Octo-SPI memory interface (OCTOSPI1/2)	28
3.25	On-the-fly decoder (OTFDEC1/2)	28
3.26	Octo-SPI I/O manager (OCTOSPIM)	28
3.27	Analog-to-digital converters (ADC1/2/3)	29
3.28	Digital temperature sensor (DTS)	29
3.29	V _{BAT} operation	29
3.30	Voltage reference buffer (VREFBUF)	29
3.31	Multifunction digital filter (MDF1)	29
3.31.1	Features	30
3.32	Audio digital filter (ADF1)	30
3.32.1	Features	30
3.33	Digital camera interface (DCMI)	31
3.34	Parallel synchronous slave interface (PSSI)	31
3.35	Digital camera interface with pixel processing (DCMIPP)	31
3.36	Camera serial interface (CSI)	32
3.37	LCD-TFT display controller (LTDC)	32
3.38	Display serial interface (DSI)	33
3.39	LVDS display interface (LVDS)	33
3.40	Video encoder (VENC)	34
3.41	Video decoder (VDEC)	34
3.42	True random number generator (RNG)	34
3.43	Hash processor (HASH)	34
3.44	Cryptographic processor (CRYP1/2)	35
3.45	Secure AES (SAES)	35
3.46	Public key accelerator (PKA)	35
3.47	Boot and security and OTP control (BSEC)	35
3.48	Timers and watchdogs	35
3.48.1	Advanced-control timers (TIM1/8/20)	36
3.48.2	General-purpose timers (TIM2/3/4/5/10/11/12/13/14/15/16/17)	37
3.48.3	Basic timers (TIM6/TIM7)	37
3.48.4	Low-power timer (LPTIM1/2/3/4/5)	37
3.48.5	Independent watchdog (IWDG1/2/3/4/5)	37
3.48.6	System window watchdog (WWDG1/2)	37
3.48.7	SysTick timer	37
3.48.8	Cortex-A35 generic timers (CNT)	38

3.49	System timer generation (STGEN)	38
3.50	Real-time clock (RTC)	38
3.51	Tamper and backup registers (TAMP)	39
3.52	Inter-integrated circuit interface (I2C1/2/3/4/5/6/7/8)	39
3.53	Improved inter-integrated circuit (I3C1/2/3/4)	39
3.54	Universal synchronous asynchronous receiver transmitter (USART1/2/3/6, UART4/5/7/8/9)	41
3.55	Low-power universal asynchronous receiver transmitter (LPUART1)	41
3.56	Serial peripheral interface (SPI1/2/3/4/5/6/7/8) inter-integrated sound interfaces (I2S1/2/3)	42
3.57	Serial audio interfaces (SAI1/2/3/4)	42
3.58	SPDIF receiver interface (SPDIFRX)	42
3.59	Secure digital input/output MultiMediaCard interface (SDMMC1/2/3)	43
3.60	Controller area network (FDCAN1/2/3)	43
3.61	Universal serial bus Hi-Speed host (USBH)	43
3.62	USB Type-C Power Delivery controller (UCPD1)	43
3.63	Universal serial bus 3.0 dual role data (USB3DR)	44
3.64	PCI Express interface (PCIE)	44
3.65	5-Gbit/s PHY controller (COMBOPHY)	45
3.66	Gigabit Ethernet MAC interface (ETH1/2)	45
3.67	Gigabit Ethernet switch (ETHSW)	46
3.68	Debug infrastructure	46
4	Pinouts/ballouts, pin description, and alternate functions	47

IMPORTANT NOTICE – READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgment.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of purchasers' products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. For additional information about ST trademarks, refer to www.st.com/trademarks. All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
